## 2 Description of the Supply Base

### 2.1 General description

Sveaskog Baltfor SIA purchases the most of its feedstock for production of biomass (woodchips): branches as wood residues from logging and branches from non forest lands, also firewood.

A small part of chips as biomass is obtained after the processing of roundwood from sawmills.

Biomass is mainly obtained from our own production.

The region of biomass origin is Latvia; a small part of biomass is obtained from Lithuania via direct purchase and supply.

Data from deliveries period:	From / Till	1 July, 2016 / 30 November, 2016
<i>Controlled Feedstock:</i>	100 %	(FSC Controlled Wood, Controlled Wood)
		The number of suppliers – 22

*SBP-compliant Primary Feedstock:* 0%

*SBP-compliant Secondary Feedstock:* 0%

*SBP-compliant Tertiary Feedstock:* 0%

*SBP non-compliant Feedstock:* 0%

Generic: Picea abies (L.) H. Karst.; Pinus sylvestris L.; Alnus glutinosa (L.) Gaertn.; Alnus incana (L.) Moench; Populus tremula (L.); Betula pendula (Roth); Betula pubescens (Ehrh.)

### LATVIAN forest resources

In Latvia, forests cover area of 3 056 578 hectares. According to the data of the State Forest Service (concerning the surveyed area allocated to management activities regulated by the Forest Law), forest Land amounts to 51.8 % (ratio of the 3 347 409 hectares covered by forest to the entire territory of the country). The Latvian State owns 1 495 616 ha of forest (48.97% of the total forest area), while the other 1 560 961 ha (51.68 % of the total forest area) belong to other owners. Private forest owners in Latvia amount to approximately 144 thousand.

The area covered by forest is increasing. The expansion happens both naturally and by afforestation of infertile land unsuitable for agriculture.

Within the last decade, the timber production in Latvia has fluctuated between 9 and 13 million cubic metres (State Forest Service: [vmd.gov.lv](http://vmd.gov.lv), 2015).

#### Forest land consists of:

- forests 3 056 578 ha (91.3%);
- marshes 175 111.8 ha (5.3%);
- glades (forest meadows) 35 446.7 ha (1.1%);
- flooded areas 18 453.2 ha (0,5%);
- objects of infrastructure 61 813.4 ha (1.8%).

(State Forest Service: [vmd.gov.lv](http://vmd.gov.lv), 2015).

**Distribution of forests by the dominant species:**

- Pine 34.3 %;
- Spruce 18.0 %;
- Birch 30.8 %;
- Black alder 3.0 %;
- Grey alder 7.4 %;
- Aspen 5.4 %;
- Oak 0.3 %;
- Ash 0.5 %;
- Other species 0.3 %.

(State Forest Service: [vmd.gov.lv](http://vmd.gov.lv), 2015)

**Share of species used in reforestation, by planting area:**

- Pine 20 %;
- Spruce 17 %;
- Birch 28 %;
- Grey alder 12 %;
- Aspen 20 %;
- Other species 3 %.

(State Forest Service: [vmd.gov.lv](http://vmd.gov.lv), 2015)

**Timber production by types of cuts, by volume produced:**

- Final cuts 81.00 %;
- Thinning 12.57 %;
- Sanitary clear-cuts 3.63 %;
- Sanitary selective cuts 1.43 %;
- Deforestation cuts 0.76 %;
- Other types of cuts 0.06 %.

(State Forest Service: [vmd.gov.lv](http://vmd.gov.lv), 2015)

**The field of forestry**

In Latvia, the field of forestry is supervised by the Ministry of Agriculture, which in cooperation with stakeholders of the sphere develops forest policy, development strategy of the field, as well as drafts of legislative acts concerning forest management, use of forest resources, nature protection and hunting (LR Ministry of Agriculture: [www.zm.gov.lv](http://www.zm.gov.lv)).

Implementation of requirements of the national law and regulations notwithstanding the type of tenure is carried out by the State Forest Service under the Ministry of Agriculture (State Forest Service: [www.vmd.gov.lv](http://www.vmd.gov.lv)).

Management of the state-owned forests is performed by the *Joint Stock Company "Latvia's State Forests"*, established in 1999. The enterprise ensures implementation of the best interests of the state by preserving value of the forest and increasing the share of forest in the national economy (PLC Latvia's State Forests: [www.lvm.lv](http://www.lvm.lv)).

In 2015 income from forest product export reached 2,010 billion euro (LR Ministry of Agriculture: [www.zm.gov.lv](http://www.zm.gov.lv)).

### **Biological diversity**

Historically, extensive use of forests as a source of profit began later than in many other European countries, therefore a greater biological diversity has been preserved in Latvia.

For the sake of conservation of natural values, a total number of 683 protected areas have been established (Nature Conservation Agency: [daba.gov.lv](http://daba.gov.lv)). Part of the areas has been included in the European network of protected areas *Natura 2000*. Most of the protected areas are state-owned.

In order to protect highly endangered species and biotopes located without the designated protected areas, if a functional zone does not provide that, micro-reserves are established. According to data of the State Forest Service in 2015 the total area of micro reserves is 40 595 ha, annually area of micro reserves slightly increases. Identification and protection planning of biologically valuable forest stands is carried out continuously.

On the other hand, for preservation of biological diversity during forest management activities, general nature protection requirements binding to all forest managers have been developed. They stipulate that at felling selected old and large trees, dead wood, under wood trees and shrubs, land cover around wet micro-lowlands (terrain depressions) are to be preserved, thus providing habitat for many organisms.

Latvia has ratified the CITES Convention (Convention on International Trade in Endangered Species of Wild Fauna and Flora) since 1997. CITES requirements are respected in forest management, although there are no species included in the CITES lists in Latvia.

### **Forest and community**

Areas where recreation is one of the main forest management objectives add up to 8 % of the total forest area or 293 000 ha (year 2012). Observation towers, educational trails, natural objects of culture history value, picnic venues: they are just a few of recreational infrastructure objects available to everyone free of charge. Special attention is devoted to creation of such areas in state-owned forests. Recreational forest areas include national parks (excluding strictly protected areas), nature parks, protected landscape areas, protected dendrological objects, protected geological and geomorphologic objects, nature parks of local significance, the Baltic Sea dune protection zone, protective zones around cities and towns, forests within administrative territory of cities and towns. Part of management and governance of specially protected natural areas (SAC) in Latvia is co-ordinated by the Nature Conservation Agency under the Ministry for Environmental Protection and Regional Development.

### **Certification**

All forest area of PLC Latvia's State Forests as well as some part of forests in private and other ownership is FSC and PEFC certified. From all forest area 3 056 578 ha approximately 1.737 million ha of Latvian forests are certified according to FSC and / or PEFC certification scheme (year 2015). Both the FSC and PEFC systems have found their way into Latvia.

## **LITHUANIAN forest resources**

Agricultural land covers more than 50 percent of Lithuania. Forested land consists of about 28 percent, with 2.18 million ha, while land classified as forest corresponds to about 30 percent of the total land area. The south-eastern part of the country is most heavily forested, and here forests cover about 45 percent of the land. The total land area under the state Forest Enterprises is divided into forest and non-forest land. Forest land is divided into forested and non-forested land. The total value added in the forest sector (including manufacture of furniture) reached LTL 4.9 billion in 2013 and was 10% higher than in 2012.

FOREST LAND BY OWNERSHIP 01.01.2014

Forest land is divided into four protection classes: reserves (2%); ecological (5.8%); protected (14.9%); and commercial (77.3%). In reserves all types of cuttings are prohibited. In national parks, clear cuttings are prohibited while thinnings and sanitary cuttings are allowed. Clear cutting is permitted, however, with certain restrictions, in protected forests; and thinnings as well. In commercial forests, there are almost no restrictions as to harvesting methods.

Lithuania has ratified the CITES Convention (Convention on International Trade in Endangered Species of Wild Fauna and Flora) since 2001. CITES requirements are respected in forest management, although there are no species included in the CITES lists in Lithuania.

Lithuania is situated within the so-called mixed forest belt with a high percentage of broadleaves and mixed conifer-broadleaved stands. Most of the forests - especially spruce and birch - often grow in mixed stands. Pine forest is the most common forest type, covering about 38 percent of the forest area. Spruce and birch account for about 24 and 20 percent respectively. Alder forests make up about 12 percent of the forest area, which is fairly high, and indicates the moisture quantity of the sites. Oak and ash can each be found on about 2 percent of the forest area. The area occupied by aspen stands is close to 3 percent.

The growing stock given as standing volume per hectare is on the average of 180 m<sup>3</sup> in Lithuania. In nature stands, the average growing stock in all Lithuanian forests is about 244 m<sup>3</sup> per hectare. Total annual growth comes to 11 900 000 m<sup>3</sup> and the mean timber increment has reached 6.3 m<sup>3</sup> per year and per hectare.

The consumption of industrial wood in the domestic forest industry, including export of industrial wood, is estimated to be less than 2.0 million m<sup>3</sup>. The remainder is used for fuel or stored in the forests, with a deteriorating quality as a result.

The potential future annual cut is calculated at 5.2 million m<sup>3</sup>, of which 2.4 million m<sup>3</sup> is made up of sawn timber and the remaining 2.8 million m<sup>3</sup> of small dimension wood for pulp or board production, or for fuel. The figures refer to the nearest 10 year period. Thereafter a successive increase should be possible if more intensive and efficient forest management systems are introduced.

Certification of all state forests in Lithuania is done according to the strictest certification in the world – the FSC (Forest Stewardship Council) certificate. The audit of this certificate testifies to the fact that Lithuanian state forests are managed especially well – following the principles of the requirements set to protection of and an increase in biological diversity.

(Resource: <http://www.fao.org/docrep/w3722e/w3722e22.htm>)

## 2.2 Actions taken to promote certification amongst feedstock supplier

Sveaskog Baltfor prefers dealing with FSC-certified companies.

Company initiates cooperation and offers better conditions of supply for FSC-certified suppliers (better payment terms, higher delivery volumes, price bonus).

Sveaskog Baltfor introduces with FSC certification uncertified suppliers and forest owners, as well as motivates to carry out their own certification.

At the time of preparation SBP certification, Sveaskog Baltfor increased the amount of woodchips, which has been certified by the FSC system, cooperation with 5 new certified biomass suppliers.

Sveaskog Baltfor management has decided to increase amount of FSC-certified woodchips purchase as much possible in 2017.

The wood obtained from non-forest lands, risks are evaluated and compliance approved according to SBP Compliant biomass status.

## 2.3 Final harvest sampling programme

The proportion of provided Biomass from primary feedstock from the base logging area is approximately 25–35% compared to other types of feedstock. Primary feedstock is obtained from Supply Base Area and is formed by roundwood (firewood, pulpwood assortment), also branches as wood residues.

Feedstock is obtained on well developed, free and open market where competition of other consumers is present. The price-lists of the assortment offered are publically available to all companies in the field of forestry. The price-lists clearly state that saw log (including finishing log) is the most valuable product, whereas wood intended for fuel (for SBP biomass) is significantly less valuable. This information is obtained from documents and data submitted by suppliers and persons involved in forest development.

## 2.4 Flow diagram of feedstock inputs showing feedstock type [optional]

Not provided.

## 2.5 Quantification of the Supply Base

### Supply Base

- a. Total Supply Base area (ha): Total area of all forest types within SPB5 236 578
- b. Tenure by type (ha): Government 2 576 616 / Privately owned 2 418 961 / Other 2 380 000
- c. Forest by type (ha): Hemi boreal area 5 236 578
- d. Forest by management type (ha): Managed natural 5 236 578
- e. Certified forest by scheme (ha): FSC-certified 2 100 023 and PEFC-certified 1 690 000

### Feedstock

- f. Total volume of Feedstock: 74 000 tonnes (indicative for year 2016)
- g. Volume of primary feedstock: 65 120 tonnes, including 29 600 tonnes (biomass from branches as wood residues from logging and firewood) and 35 520 tonnes (biomass from branches from non forest lands)

- h. List percentage of primary feedstock (g), by the following categories.  
Subdivide by SBP-approved Forest Management Schemes:
  - Certified to an SBP-approved Forest Management Scheme:0%
  - Not certified to an SBP-approved Forest Management Scheme:100%
- i. List all species in primary feedstock, including scientific name:  
Picea abies (L.) H. Karst.; Pinus sylvestris L.; Alnus glutinosa (L.) Gaertn.; Alnus incana (L.) Moench;  
Populus tremula (L.); Betula pendula (Roth); Betula pubescens (Ehrh.)
- j. Volume of primary feedstock from primary forest: 0%
- k. List percentage of primary feedstock from primary forest (j), by the following categories. Subdivide by SBP-approved Forest Management Schemes:
  - Primary feedstock from primary forest certified to an SBP-approved Forest Management Scheme: 0%
  - Primary feedstock from primary forest not certified to an SBP-approved Forest Management Scheme: 0%
- l. Volume of secondary feedstock: specify origin and type:
  - woodchips(sawmills residues) as residues of wood industry bought within origin Latvia: 8 880 tonnes
- m. Volume of tertiary feedstock: specify origin and composition: 0%tonnes

### 3 Requirement for a Supply Base Evaluation

SBE completed	SBE not completed
✓	☐

SBP Biomass supply evaluation includes:

- **Primary** feedstock (woodchips from firewood and branches as wood residues from logging)
- **Non-forest land** feedstock (woodchips from overgrown agricultural areas, powerline and ditch areas branches after clearing)

Sveaskog Baltfor SIA defines the biomass received from approved biomass sources and supplies as SBP-compliant biomass.

Risk categories and justification for both cases is “specified risk” in those indicators whose risk level has been changed during the Regional Risk assessment process, have been reviewed taking into consideration operational profile of Sveaskog Baltfor SIA

Reviewed risk assessment has been sent out for public consultations.  
 Risk assessment (RA) was sent for public consultation on 12 September 2016.

Risk assessment is divided into “Low risk”, “Specified risk” or “Unspecified risk”.

## 4 Supply Base Evaluation

### 4.1 Scope

4.1.1. It refers to primary feedstock supplies (firewood) from the Latvian forest properties after logging.

4.1.2. It refers to primary feedstock purchases in forest (branches) from the Latvian forest properties after logging.

4.1.3. It refers to primary feedstock supplies(branches) from the Latvian overgrown agricultural land areas, ditches and roadsides after clearing.

### 4.2 Justification

The risk assessment has been developed in accordance with SBP Standard 1 V1.0 and SBP Standard 2 V1.0 of March 2015, assessing the risk categories for each SBP indicator. While describing and assessing the risks, company acquired an in-depth understanding of the wood supply risks that could affect the acceptance of SBP non-compliant material for biomass production.

By introducing efficient risk mitigation measures, company has the option to purchase SBP approved and compliant assortment to produce the required amount of SBP compliant biomass products.

The classification of developed risk indicators is graded from potential risk to lower risk.

At first company reviewed risk level for each indicator on the basis of the draft version of SBP Regional Risk assessment for Latvia V1.0, developed by NEPCon and based on SBP Standard 1 V1.0 of March 2015.

The designated risk specifications for “Specified risk” indicators and those indicators whose risk level has been changed during the risk assessment process (for example, 1.1.2, 1.4.1, 2.2.5, see draft version of Regional Risk Assessment for Latvia) were reviewed, evaluated in line with requirements of national legislation, national policies (forest sector, nature protection, biodiversity etc), annual reports and publications of national responsible institutions and authorities). In addition to this, the risk specification has been consulted with stakeholders and leading experts in nature protection and forestry sectors.

During consultation with interested parties and through communication with biomass suppliers, additional information related to current “Specified risk” and “ Low risk” indicators has been obtained, however, no changes in risk designation for given indicators were made. Thus, the risk assessment reviewed by the Sveaskog Baltfor SIA does not differ from the draft Regional Risk Assessment for Latvia.

Reviewed Risk assessment has been checked via public consultation with the stakeholders according to requirements of SBP Standard 1 V1.0

Sveaskog Baltfor SIA as a wood processing and forestry company with more than 20 years of experience, as well as by attracting independent experts of biotope and nature conservation specialists, has developed risk mitigation and control mechanisms to assess and validate the biomass supplies and suppliers whose products correspond to SBP-compliant biomass status.

To develop a SBE system, supply assessment and risk mitigation measures have been performed by Sveaskog Baltfor SIA by attracting the existing staff, Production manager, who has more than 10 years experience in woodchips production and trade, experience and knowledge of forestry and wood procurement

and legislation matters; Environment and Quality manager, who has more than 5 years experience in FSC, ISO system maintenance and development, also attracting outsourcing provider company Lodret SIA consultant - Wood processing technologist with more than 20 years experience in the timber industry, 10 years experience as the leading auditor of FSC, PEFC forestry and supply certification.

### 4.3 Results of Risk Assessment

The requirements of Latvian normative acts were included in the risk assessment analysis.

Taking into account the specific character of Latvia and expert advices and recommendations "Specified risk" was applied to biotope protection (HCV category 3), work safety, bird habitat conservation (HCV category 1) and cultural and historical sites (HCV category 6).

### 4.4 Results of Supplier Verification Programme

SBP approved supplier audits and results described below and associated with specific risks are available to third parties and interested parties by documentary evidence of the audits performed.

The information obtained during risk assessment from both the legislative and the physical information verification on site on all SBE risk categories has confirmed that "Specific risk" are applicable to 4 categories: biotope protection (HCV category 3), work safety, bird habitat conservation (HCV category 1) and cultural and historical sites (HCV category 6), whereas the risk for other categories is low.

Risk assessment and risk mitigation mechanism in primary feedstock compliance audits confirmed the urgency of defined risks in forestry and outside forest lands.

### 4.5 Conclusion

Since August 1, 2016 when the requirements of SBE standards were initiated and introduced, the compliance of feedstock suppliers to specific risks was reviewed. Only a small part of suppliers who have direct logging and the competence to assess potential risks is recognized suitable as SBP suppliers for wood that is not certified according to the requirements of FSC or PEFC standards.

The amount of FSC or PEFC certified forests and access to certified wood is insufficient to ensure that at least 70% of the biomass is SBP-compliant biomass.

As a result of risk mitigation measures, Sveaskog Baltfor SIA has confirmed that risk mitigation measures can be provided at our own forestry and conform to SBE low risk category at supply level.

Also when Sveaskog Baltfor inspecting and performing risk mitigation measures to his supplier before logging in certain production area, can be provided that risk mitigation measures are effective and meet SBE low risk category at supply level.

## 5 Supply Base Evaluation Process

Sveaskog Baltfor SIA SBP-compliant biomass assessment refers to supplies from Latvia only and obtaining of biomass from:

- SBP-approved forestry certification scheme;
- SBP-low risk feedstock sourced within SBE system;
- SBP approved supply chain (CoC) system requirements;
- SBP-approved supply from outside forest lands.

Risk assessment results were obtained by carrying out audits at logging companies which approved taking necessary measures for risk mitigation. Additional consultation with other forestry and logging companies was carried out, and the results and experience obtained was publically discussed with non-governmental organizations.

During confirmation of fulfilment of SBP requirements and assessment of the competence of suppliers, loggers and processors, experts in work safety, biotope and bird nest exploration and identification of possible cultural and historical sites were involved.

The company has developed and implemented a risk mitigation procedure where the identified risk mitigation measures and tools are described.

Questionnaires to test each risk indicator were designed and applied to objectively assess and obtain all information on each wood acquisition site, which is or is not approved as SBP compliant biomass.

Audit frequency and plan is designed so that timber from felling (forest management units) that originates from approved cutting area is audited in a 6-month period. Audits are performed prior to and during logging. The audit procedure is available at the company only by request, taking into account confidentiality, and is presented and discussed with interested parties to improve it effectively.

## 6 Stakeholder Consultation

On 12<sup>th</sup> September 2016, Sveaskog Baltfor published SBP risk assessment on its website. An informative letter was sent electronically to the interested parties on the risk assessment developed according to SBP standard.

The list of interested parties was created so that it includes the maximum number of recipients that represent economic, social and environmental interests of society, as well as local municipalities.

The total number of recipients is 59 correspondents.

SBP risk assessment is available on the company website:

[http://sveaskog.se/Documents/Sveaskog%20Baltfor%20Sia/Sveaskog%20Baltfor\\_SBP\\_risk\\_assess\\_Latvia\\_v1.pdf](http://sveaskog.se/Documents/Sveaskog%20Baltfor%20Sia/Sveaskog%20Baltfor_SBP_risk_assess_Latvia_v1.pdf)

### 6.1 Response to stakeholder comments

At the time of the SBR final version is published and submitted to NEPCon SIA, no recommendations, comments or complains regarding the risk assessment or risk mitigation measures actions as a such and risk mitigation process implementation had not been obtained.

## 7 Overview of Initial Assessment of Risk

Sveaskog Baltfor reviewed risk level for each indicator on the basis of the draft version of SBP Regional Risk assessment for Latvia V1.0, developed by NEPCo and based on SBP Standard 1 V1.0 of March 2015.

The designated risk specifications for “Specified risk” indicators and those indicators whose risk level has been changed during the risk assessment process (for example, 1.1.2, 1.4.1, 2.2.5, see draft version of Regional Risk Assessment for Latvia) were reviewed, evaluated in line with requirements of national legislation, national policies (forest sector, nature protection, biodiversity etc), annual reports and publications of national responsible institutions and authorities). In addition to this, the risk specification has been consulted with stakeholders and leading experts in nature protection and forestry sectors.

After the publication of the risk assessment Sveaskog Baltfor had started risk mitigation process for 3 “Specified risk” categories.

Risk assessment results are summarised in the table 1 below.

After the publication of the risk assessment Sveaskog Baltfor had started risk mitigation process for 3 “Specified risk” categories verification in nature. The results are reflected in paragraphs 7 and 8 below.

Table 1. Overview of results from the risk assessment of all Indicators (before supplier control program)

Indicator	Initial Risk Rating		
	Specified	Low	Unspecified
1.1.1		X	
1.1.2		X	
1.1.3		X

## 8 Supplier Verification Programme

### 8.1 Description of the Supplier Verification Programme

Risk mitigation measures refer to the following feedstock categories:

- primary feedstock supplies from Latvian forest properties prior to and after logging, as well as during the logging;
- primary feedstock supplies from Latvian overgrown agricultural land areas, power lines and ditches;
- not applicable to secondary feedstock and other regions of origin;
- primary biomass is not qualified and is not applicable to tree species such as oak, ash, maple, fluttering elm, if the diameter on the stump exceeds 70cm.

**Sveaskog Baltfor SIA SBP suppliers groups in two categories:**

**1<sup>st</sup> category: SBP-compliant supplier** – the suppliers who have signed an agreement on the supplies of SBP compliant feedstock and are trained in identification of risk categories; the supplier tests feedstock supplies from all wood units of origin; the supplier has been audited and received written confirmation from Sveaskog Baltfor.

If the supplier has not assessed the logging unit and has ignored any of the risk categories that it has not identified or has concealed, the supplier is excluded from SBP-compliant feedstock supplier list.

**2<sup>nd</sup> category: SBP non-compliant supplier** – includes all suppliers that have not performed risk assessment for the entire amount of supplied wood and with whom an agreement has not been signed on SBP-compliant feedstock supplies. The supplier has been trained on risk identification, but the supplier does not carry out risk mitigation measures using Sveaskog Baltfor risk mitigation tools. The supplier may be audited, but has not received written confirmation from Sveaskog Baltfor.

**An independent, international auditing company** performs the compliance assessment and verification of the suppliers approved by Sveaskog Baltfor. If the audit finds that any of the suppliers has ignored risk categories during audit, the assessment programme is reviewed, and the supplier is excluded from SBP-compliant feedstock supplier list.

During the development process of SBP certification, the company assessed SIA Sveaskog Baltfor own logging in forest and outside the forest lands.

Audits are carried out both for approved suppliers by carrying out checks at least 1 x 3 months, in order to ensure compliance with SBP requirements and for unapproved suppliers at least 1x a year before or after the logging period.

Unapproved suppliers that are competent in risk category assessment and have expressed an interest in supplying SBP compliant biomass are included into the additional monitoring programme, which involves testing prior to commencement of logging. The minimum criteria for approving SBP-compliant suppliers are described in the company procedures.

The number and selection of sites to be visited is planned in advance, one month before the logging, receiving information on planned logging sites, cadastral numbers, and felling coordinates from both approved and unapproved suppliers.

For obtaining additional information, the following information sources are used: Natural Data Management System "Ozols" of the Nature Conservation Agency (Nature Conservation Agency: <http://ozols.daba.gov.lv/pub/>).

On the Nature Conservation Agency information available, recommendations of forestry and nature protection experts. In the auditing process during interviews with suppliers, confirmation is obtained that the supplier understands the risks associated with sustainable biomass sourcing, the supplier correctly identifies risk categories and takes measures necessary to mitigate the risks.

The objective of Sveaskog Baltfor within SBP certification is to verify all feedstock suppliers by performing audits and assessing their compliance with the requirements of SBP standards, the competence and skills of risk identification associated with the 3 afore mentioned risk categories for Latvia.

All suppliers, whether approved or unapproved, are subjected to assessment of the work safety system of the logging company, a set of measures taken by the company to conserve biotopes, including identification of possible signs of biotopes prior to the start of logging, preservation of cultural and historical values and protection of bird nests.

During the suppliers audit, the way company carries out risk mitigation measures is examined by reviewing the completed audit forms approved by a biotope expert (check form, control form) - reports, which makes it possible to conclude whether the company is ready to supply SBE-compliant feedstock, whether the supplier needs to take corrective measures and the audit needs to be repeated.

During risk mitigation process all the possible forest and outside forest area felling sites are inspected and audited at Data Management System "Ozols" <http://ozols.daba.gov.lv/pub/>

## 8.2 Site visits

The audits are carried out selectively prior to logging or during logging.

As a priority, those properties and plots are visited that show signs of potential biologically valuable stands forest - biotopes of European significance, natural forest biotopes.

**For planning the number of audits for each supplier, Sveaskog Baltfor uses the following formula:**

$$0,8\sqrt{FMU} = x \text{ FMU}$$

FMU- planned number of fellings per year

X FMU- the number of fellings to be visited prior or during logging

The auditable areas and suppliers are selected so that both supply regions and a variety of wood harvesting companies and their sub-contractors and service providers are maximally covered. The wood sourcing regions included in the audit programme are: Kurzeme, Vidzeme, Zemgale, Latgale.

25 management units - forest properties, overgrown agricultural land areas - were visited within the framework of the programme for identification of potential biotopes, bird nests, cultural and historical sites and work safety risks, and risk mitigation;

5 forest property units were visited before logging was started;

2 forest properties - during logging;

18 non-forest land properties were visited prior and after logging;

20 work safety audits at the loggers and their sub-contractors, and service providers.

## 8.3 Conclusions from the Supplier Verification Programme

### **Work protection and work safety risk monitoring programme**

Work protection audits started on September. The audits were pre-planned and carried out for all suppliers, 20 audits in total (which is 70 % of all suppliers, including suppliers, logging companies and their contractors, wood processors) during logging, having requested information from suppliers about logging sites and service providers in advance. The auditable areas and suppliers are selected so that both supply regions and a variety of wood harvesting companies and their sub-contractors are maximally covered. The regions included in the audit programme are: Kurzeme, Vidzeme, Zemgale, Latgale. Records and observations are made for each supplier audit.

Work protection and work safety risks related to logging for both forest lands and outside forest lands can be divided into two categories:

- 1) Logging with mechanized multi-operational harvesting machines (harvesters) maximally minimizes risks related to work protection and work safety. Minor deficiencies were found during the audits.
- 2) A high work safety and work protection risk was found for 50% of the audited forest fellings where logging was performed using hand motor-saws. Audits found significant discrepancies in work safety, and the management of the companies under inspection was invited to pay increased attention to work protection.

### **Identification of biotopes, bird habitats and cultural and historical sites, and monitoring risk programme**

The audits of biotope monitoring risk programme were started on September. In the framework of the programme, prior to and during logging, those fellings and adjoining areas were audited where according to Ozols Natural Data Management System, potential possibility of natural forest biotopes was identified.

The auditable areas and suppliers are selected so that a variety of supply regions and wood harvesting companies and their sub-contractors are maximally covered. Kurzeme, Vidzeme, Zemgale and Latgale regions are included in the audit programme. Records and observations are made for each audit.

The following conclusions were made from the audits:

- 1) The suppliers have an understanding of the biotope evaluation mechanism; the suppliers are aware of the need for biotope assessment audit prior to starting the logging. During audits, potential felling areas in economic forests or on agricultural lands were inspected on site with a small possibility of a forest biotope. In case of doubt, a forest and meadow biotope expert was invited or consulted.

- 2) In the logging process, no objects of cultural or historical value were found in the selected forest areas. The audits found that suppliers are aware that the protection of cultural values is governed by Latvian legislation. It has been concluded from the survey of the logging companies that if during logging an object of cultural or historical value is found in the felling area, the State Forest Service and a relevant municipality are informed about it in written manner. The logging is suspended until an appropriate decision from the competent authorities is received.
- 3) No large bird-nests (over 50 cm) were found during audit of inspected felling areas. The suppliers are aware of the actions to be taken if large bird-nests (over 50 cm) are found. The logging companies are aware of the need to leave deadwood and ecological trees, as well as to comply with the other requirements of nature protection in forest management. It was found during audits that different logging restrictions set by administrative territories are observed.

It was found during audit that the logging companies are ready to show Sveaskog Baltfor auditor the territories that are left as biologically valuable forests (forest biotopes of EU significance, natural forest biotopes) and where logging will not be performed or the administration of the company Sveaskog Baltfor will be informed. Wood from these forest units / properties (farms) will not be supplied.

## 9 Mitigation Measures

### 9.1 Mitigation measures

9.1.1. Risk mitigation measures refer to the following biomass supply risk categories:

- Identification of the signs of forest biotopes and natural forest biotopes of European significance,
- Identification of cultural and historical monuments and objects of cultural and historical value in the process of logging,
- Identification of bird nesting sites,
- Mitigation of work protection and work safety risks.

The audit process: Surveillance audits are performed selectively for all suppliers, whether approved as SBP suppliers or not.

For the suppliers that are approved as SBP-compliant feedstock suppliers, audits and assessment of all categories is performed only prior to or during logging.

Audits for the harvesting of agricultural lands during logging are performed prior to or during logging for all logging objects with assessment of all possible risks.

After the results of surveillance audits and the assessment of a supplier, the company management makes a decision on further co-operation with the supplier, the conditions and amount of wood supply. The suppliers that refuse to inform Sveaskog Baltfor on the planned amount of logging and refuse to cooperate with Sveaskog Baltfor during audits may be excluded from the list of suppliers.

By involving appropriate biotope experts, specialists, and forest management work safety specialists, Sveaskog Baltfor provides additional informative seminars for suppliers in order to better inform suppliers with SBP requirements for the conditions of supplying compliant feedstock and of potential risks, thus minimizing the risks of supplying feedstock that does not *comply with the requirements of SBP standards*.

9.1.2. General description of risk mitigation system:

#### **General measures of risk mitigation:**

The purchase of FSC certified wood as priority for procurement of SBP-compliant biomass.

Signing supply contracts and including the conditions of SBP standards for biomass supply, identifying and decreasing in a timely manner the risks of supplying SBP non-compliant feedstock.

Performing biotope risk assessment procedures prior to logging, during or after logging, which includes the following measures:

Checking for the presence of a forest biotope of European significance, the potential forest biotope (FB) in each procured forest area, using natural data management system "OZOLS" [http://www.daba.gov.lv/public/lat/dati1/dabas\\_datu\\_parvaldibas\\_sistema\\_ozols/http://www.daba.gov.lv/public/lat/publikacijas/parskati\\_zinojumi/](http://www.daba.gov.lv/public/lat/dati1/dabas_datu_parvaldibas_sistema_ozols/http://www.daba.gov.lv/public/lat/publikacijas/parskati_zinojumi/)

An assessment audit form before logging is designed where all 3 risk categories are included.

The form has been designed in collaboration with forest biotope experts to identify and minimize the impact on possible biotopes, to recognize and protect cultural and historical objects and bird nesting sites.

9.1.3. Risk mitigation measures non-woodland territories (arable land, agriculture land, meadows, gardens, and ditches), wood risk identification and risk reduction measures:

The developed risk assessment, criteria, audit process also applies to non-woodland territories, the following territories are being defined as non-woodland in accordance with the LR Forest Law:

- land occupied by existing road network land section strips, railway land section strips, electrical networks and electronic communications overhead line network routes, gas pipelines, oil pipeline routes, water supply routes and cemeteries, artificial or natural tree rows with a width of maximum 20 metres, orchards, parks, tree nurseries;

- territories existing separately from woodlands, but meet the definition of woodlands in accordance with [Clause 1](#), Paragraph 34 and are less than 0.5 ha in size.

The non-woodland wood materials are checked according to the criteria both in the pre-processing and post-processing phases.

The suppliers submit information in the previous month before processing, indicating the cadastral numbers.

Cadastral numbers are being checked according to data bases whether a possibility is present of any of the risk groups applying, also, whether or not wood acquisition from protected areas is planned, such as meadow areas of conservation.

Assessment of risks for non-woodland territories applies in the same amount as regarding woodlands;

Wood purchasers carry out audits using already approved biotope questionnaires, with the only exception of identifying the type of non-woodland territory in accordance with the data from cadastre, and in accordance with the data from documents of land property usage.

Wood purchasers utilise information available in the data base of Latvian State Service (VZD) <https://www.kadastrs.lv/>:

as regards distribution of units of land according to real estate target use groups, and land usage types, this information is available from sites where data are registered, for instance, according to property and ownership rights;

“Distribution of land according to real estate target use groups”

<http://latvijas.daba.lv/biotopi/plavas.shtml>

If during the inspection and evaluation of the overgrown non-woodland areas there are doubts of possible biotope, the wood purchasers contact the experts of lawns (meadow territories) in order to acquire additional data on the found indicators, or ensure access of experts to the site

Wood purchasers, before processing the non-woodland territories, evaluate the conditions of the processing, possible ground water height, applicable processing techniques to reduce the pressure of the machinery on the ground surface, as well as to prevent penetrations of enlarged grooves.

9.1.4. The process of work protection and work safety risk assessment takes place during logging, during which a logging master performs checks according to a special form that includes minimal requirements for maintaining work safety in the forest. The form is designed in collaboration with a company licensed work safety specialist.

- 9.1.5. Trainings and seminars are provided for the company logging masters and biomass suppliers. The objective of the trainings is to teach loggers and suppliers to recognize the signs of potential possible biotopes, bird nesting sites, cultural and historical objects, and to fully guarantee work safety requirements at our own company and the companies of service providers.
- 9.1.6. The assessment of the efficiency of risk mitigation measures and results of audit are available upon request from the interested parties by meeting in person and explaining the mechanism and benefits of general risk mitigation measures, and by promoting further cooperation in the process of identifying risk mitigation.

## 9.2 Monitoring and outcomes

Due to findings, during supplier audits, work safety violations and a lack of cooperation with Sveaskog Baltfor in the identification of the presence of biotopes, and in mitigating the risks of supplying SBP non-compliant feedstock, 2 suppliers (loggers) were not approved for wood supply.

After on-site surveillance audits, having assessed the risks of possible biotopes and work safety, the company management decided to exclude from the supplier list those suppliers that during audit did not meet the acceptable performance criteria of the risk mitigation programme established by the company.

Supply regions: Kurzeme, Zemgale, Vidzeme, Latgale.

After SBP risk mitigation audits, as well as supplier training for suppliers who are forest owners, logging companies have developed an understanding of SBE requirements regarding risk categories, their recognition and mitigation mechanism.

Detailed information on each indicator is provided in the risk assessment.

Risk assessment is available at:

[http://sveaskog.se/Documents/Sveaskog%20Baltfor%20Sia/Sveaskog%20Baltfor\\_SBP\\_risk\\_assess\\_Latvia\\_v1.pdf](http://sveaskog.se/Documents/Sveaskog%20Baltfor%20Sia/Sveaskog%20Baltfor_SBP_risk_assess_Latvia_v1.pdf).

## 10 Detailed Findings for Indicators

Detailed findings for each Indicator are given in Annex 1.

## 11 Review of Report

### 11.1 Peer review

The final version of SBR report was sent to professionals in wood industry, forestry and processes of forest environment.

The report was reviewed and comments were received from:

Janis Rozitis, CEO and Forest Programme Manager, Pasaules Dabas Fonds (WWF associated partner):

The information provided in basic delivery report of SIA Sveaskog Baltfor and its section “Latvian forest resources” complies with the mentioned sources.

In section “Measures taken to motivate raw material supplier certification” states the practical activities of SIA Sveaskog Baltfor in order to promote the system of FSC in Latvia, and increasing the raw material supply compliant with FSC by raising it also in the year 2017. Such activities of SIA Sveaskog Baltfor shall be evaluated as very positive by directly supporting the development of responsible forest management in Latvia. In its report SIA Sveaskog Baltfor rightly indicates company risk factors for supply of raw materials:

- Preservation of European importance forest biotopes and other natural forest biotopes,
- preservation of bird habitats,
- preservation of cultural and historical sites,
- monitoring measures of health and safety, especially in regard to work safety.

The risk mitigation measures mentioned in basic supply report are likely to reduce or prevent the risk factors. As positive evaluation must be attributed to the fact that the company focuses on evaluation of all 4 risk factors prior to the wood processing on-site. At this point, results of the supplier audit mentioned in the basic report already show functionality of the system by excluding suppliers who are working inadequate to the requirements from woodworking supplies.

SIA Sveaskog Baltfor analyses results of the supplier supervision auditing, a suggestion would be to pay more attention to filling in the specially developed assessment audit forms in practice. Generally, it would be advisable for the company to continuously assess information acquired either in the public domain, or directly, from habitat/biotope, species and social experts, non-governmental organizations and local municipalities, especially in regard to the risk factors established in the Republic of Latvia, and more so – with particular emphasis on the need to keep up with the latest available information on the biotopes of EU importance and natural forest biotopes, both known and potential. If necessary, SIA Sveaskog Baltfor should complement and introduce more stringent risk mitigation measures and requirements of audit monitoring system.

SIA Baltfor Sveaskog has been engaged in training of employees and suppliers. In future, the following needs to be carried out:

outreach activities, qualification trainings for the responsible company employees, forestry operators, suppliers of raw materials on preservation of the heritage of natural biodiversity, cultural and historical heritage sites, as well as work safety measures.

### 11.2 Public or additional reviews

No additional reports or additional information.

## 12 Approval of Report

Approval of Supply Base Report by senior management			
Report Prepared by:	<i>Marta Ciekure</i>	<i>Environment and quality manager</i>	<i>12.12.2016.</i>
	Name	Title	Date
The undersigned persons confirm that I/we are members of the organization's senior management and do hereby affirm that the contents of this evaluation report were duly acknowledged by senior management as being accurate prior to approval and finalisation of the report.			
Report approved by:	<i>Guntars Zvejsalnieks</i>	<i>Managing Director</i>	<i>15.12.2016.</i>
	Name	Title	Date

## 13 Updates

### 13.1 Significant changes in the Supply Base

Not applicable.

### 13.2 Effectiveness of previous mitigation measures

Not applicable.

### 13.3 New risk ratings and mitigation measures

Not applicable.

### 13.4 Actual figures for feedstock over the previous 12 months

01.12.2015. – 01.12.2016.      70 000 – 80 000 tonnes

### 13.5 Projected figures for feedstock over the next 12 months

01.12.2016. – 01.12.2017.      70 000 – 80 000 tonnes

# Annex 1: Detailed Findings for Supply Base Evaluation Indicators

## Scope and regional background

The scope of this risk assessment is restricted to within Latvia's national border. The length of Latvia's state border is 1840 km in total. The length of the country's sea border is 490 km, while 1350 km of the state border extends in land. Latvia borders on four countries: to the north - with Estonia (343 km), to the east - with Russia (276 km), to the south-east - with Belarus (161 km) and to the south with Lithuania (576 km). Latvia has a territorial area of 64 600 km<sup>2</sup>. See map in Figure 1. The nature conditions in Latvia are determined by its geographical position, the western part of the Eastern European plateau. An important nature diversity factor is the country location, which is a moderate climate zone of mixed forests. The country is located between the boreal forest zone and the temperate broadleaf forest zone, which is characterised by a rich biological diversity, in which the traits of both boreal forest and broadleaf forest nature zones can be observed. The dominant tree species in Latvia are Pine (Scots pine), Birch (Silver birch, Downy birch) and Spruce (Norway spruce). Grey alder, Common aspen and Black alder also cover significant areas of the country. The remaining tree species found in Latvia grows in relatively small areas.

Forests in Latvia occupy 3,020,575 ha or 50% of the total land area. Compared with other European countries, Latvia is among the most forest-rich countries (forests in Europe occupy 33% of the land area on average). The State owned forests in Latvia occupy 1,495,136 ha (49.5% of the total forest area) while private forest cover an area of 1,525,439 ha (50.5% of the total forest areas). State forests are managed by the State enterprise AS Latvijas Valsts Meži (LVM). According to the statistics, the total forest area in Latvia is increasing.

There are 144 thousand private forest owners (physical persons) who own 35% of the forest area. 14% forests are owned by legal entities, 49% in total. The rest is owned by the state (49%) and municipalities, state institutions (Ministry of Environment, Ministry of Defence etc.) (2%).

The country is considered homogenous with regard to SBP risks, just like other forestry and forestry related risks therefore no further sub-division is needed. Where differences in regards to forest ownership are identified it is explicitly mentioned under the finding of each indicator.

The Ministry of Agriculture is the responsible government body in the forest sector. The State Forest Service is the subordinated authority under the Ministry of Agriculture and their competencies are monitoring of forest management, use and hunting regulatory legislation compliance, monitor and enforcing forest fire-fighting and participate in national forest policy development and implementation.

The forest industry accounts for around 20% of the Latvian industry added value. The industry employs approximately 5% of the total labour force in the country. Around 70-80% of the products are exported, thus influencing the Latvian foreign trade balance in a positive way.

State forests are FSC/PEFC certified. In addition to the state forest enterprise, 6 private forest managers are managing forests in accordance with the FSC standard requirements. The FSC certified area in the country amounts to a total of 1,743,157 ha, including 248,021 ha of private forest land. 210 FSC Chain of Custody certificates are in operation in the country. A total of 1,683,641 ha forests are PEFC certified. 29 companies

are certified according to the PEFC Chain of Custody certification scheme. The figures above are correct as of April 2015.

Figure 1. Map of Latvia. Source: Google map.

	Indicator
1.1.1	The BP Supply Base is defined and mapped
Finding	<ul style="list-style-type: none"> <li>The biomass supply base includes the main feedstock producers in Latvia, which are forest managers - state forest enterprise AS Latvijas Valsts Meži, municipalities, churches, private forest owners and timber processing industry importing and producing (feedstock received during timber processing, feedstock from energy plantations and feedstock received from outside forests) the biomass products. The main biomass products provided for the market from sawmills and other timber industry entities in general are twofold: round wood and secondary feedstock such as sawdust and shavings. These materials can be sourced from primary feedstock producers from Latvia such as state, municipal forest managers, private forest owners and other local timber industry entities importing and/or producing it during timber processing when mixing local timber material with other imported material. Nevertheless, the definition of the supply base on the production level (sawmills etc.) is clear, however tracing back source material to the defined supply base could be difficult in case feedstock material is supplied from several countries. (see criteria 1.2.1).</li> <li>With regard to the supply base and mapping at the forest level the main planning document that serves for description of the supply base in both state and private</li> </ul>

	<p>forests is the Forest Management Plan providing description of forest resources, assessment, monitoring and planning of forest resources with corresponding maps defined for forest owners. The Regulations on Forest Inventory and State Forest Register and Regulations on Forest Management Plans defines the procedures for preparation, approval and registration, content and quality review of the forest management plans. Forest management plans are prepared for a 20 years period and includes analysis and inventory of the forest resources for the previous period as well as detailed resource description and data inventory records of the current cycle. Instruction on forest management planning defines the requirements for data and map description to be included into the management plan. In forest management plans maps are used for specifying the planned activities and locations.</p>
Means of Verification	<ul style="list-style-type: none"> <li>• The Scope is defined and justified;</li> <li>• Maps to the appropriate scale are available;</li> <li>• Felling Permits, transport and procurement documents</li> </ul>

Risk Rating	<input checked="" type="checkbox"/> <b>Low Risk</b> <input type="checkbox"/> <b>Specified Risk</b> <input type="checkbox"/> <b>Unspecified Risk at RA</b>

	Indicator
1.1.2	Feedstock can be traced back to the defined Supply Base
Finding	<p>The Latvian timber processing industry traditionally imports roundwood and sawn wood from neighbouring countries. The supply base of sawmills and other timber processing entities include a mix of local timber and feedstock material – roundwood, sawn wood as well as chips, sawdust and feedstock imported from other countries. Main wood import partners are neighbouring countries - Lithuania, Estonia, Russian Federation and the Republic of Belarus as well as other EU countries –Poland, Sweden, Germany, Netherlands and EEC country Norway.</p> <p>As the feedstock production process in sawmills is quite complicated and it is difficult to track the raw material back to supply back and amount of mixed timber during the production process, it is necessary to analyse the composition of feedstock sources and material type used for biomass processing. Since biomass processing companies in Latvia utilise feedstock supplied from non EU countries with a high corruption index and subsequent specified risk for feedstock legality it must be evaluated how significant the risk level is for feedstock material imported from abroad.</p> <p>The statistics shows that the share of imported roundwood has been instantly increasing over the last 5 years from 1.3% in 2009 to 9.8% in 2014. Considering the roundwood used for processing, i.e. excluding the exported volume of roundwood, the share of imported roundwood ranges from 1.8% in 2009 to 13.9% in 2014. Major</p>

volumes of roundwood is imported from Lithuania whose share accounts for more than 2/3 of the total volume of imported roundwood in the last years. The share of imported roundwood from the Republic of Belarus has been decreasing in favour of imported roundwood from Lithuania. The share of imported roundwood from the Republic of Belarus shows an instantly decreasing trend over the last 5 years, i.e. from 55% in 2009 to 18% in 2014 (2010 - 55%; 2011 - 40%; 2012 - 34%; 2013 - 25%). Imports of sawn wood constitute about 1/3 of the total wood (roundwood and sawn timber) import. The biggest volume of sawn wood imports originates from Estonia, Republic of Belarus and the Russian Federation. Sawn wood constitutes a smaller volume out of which the certain amount is mixed with local timber during the timber processing and can be provided to the market in the form of biomass products.

The biggest volume of roundwood and sawn wood in the last years is imported from countries with low risk with regard to legality of roundwood origin (characterised by Transparency International's Corruption Perception Index, FSC Controlled Wood Risk Assessment). But roundwood sourcing countries such as the Republic of Belarus, Russian Federation and Ukraine traditionally have specified risk in regard to the legality of roundwood origin characterised by the Corruption Perception Index (Transparency International) and FSC Controlled Wood Risk Assessment results.

The share of imported roundwood from the Republic of Belarus, Russian Federation and Ukraine in the roundwood basket of Republic of Latvia is in the range of 0.72% in 2009 to 2.36% in 2014. (2010 – 2.14%, 2011 – 1.34%, 2012 – 1.89%, 2013 – 2.1%). When excluding the exported roundwood, the share of imported roundwood from the mentioned countries is in the range of 1% to 3.3% in the last 5 years. Considering both roundwood and sawn wood import, the share of imported wood from the Republic of Belarus, Russian Federation and Ukraine was in the range of 1.3% in 2009 to 4.5% in 2014.

The specification of level of risk and significance for this indicator were discussed during the stakeholder consultation process. Stakeholders have underlined that the share of imported timber from countries with a specified risk level with regard to the timber legality, i.e. the Russian Federation, the Republic of Belarus and Ukraine, is small. Most of the timber imported to Latvia from the Russian Federation is FSC certified or controlled material (FSC Controlled Wood), supported by the fact that timber from Russian Federation is mostly purchased by large sawmills that are FSC/PEFC certified. The share of imported roundwood from Russian Federation in imported roundwood basket is small, but growing i.e. 6% in 2014, 2% in 2013 and below 1% during the period from 2009-2012. With regard to sawn wood, the share of lumber import from Russian Federation has been fluctuating in range of 15%-30% of all lumber import over last 5-year period

In the Republic of Belarus the majority of the State forests are FSC/PEFC certified and the timber is sold through the Belarus Timber Exchange. The share of roundwood import from the Republic of Belarus has been steadily decreasing over the last 5-year period: from 55% of all roundwood import in 2009 to 18% in 2014. The share of lumber import from the Republic of Belarus has been in range of 17%-27% over the last 5 year period without exhibiting particular trend.

Imported timber volumes from Ukraine are rather negligible to consider. The statistical data show that import of lumber from Ukraine is ranging from 0.7%-1.7% in last 4 years not exhibiting particular trend. There have been no roundwood supplies from Ukraine during last 5 years according to statistical data.

In addition, the large share of timber and timber products imported from both countries is re-exported to third countries, primarily other European Union countries. Thirdly, further enforcement of the EU Timber regulation further minimizes the risks of importing and placing timber of unknown or illegal origin on the EU market. Information from the EUTR Competent Authority – the State Forest Service shows that enforcement of the EU Timber Regulation is taking place, i.e. legislation regarding penalties and confiscation, covering all timber products as provided in the EUTR, has been in place since the 1st of July 2015. Furthermore, the EU Timber Regulation

	<p>Competent Authority is constantly working on implementation of their audit system on imported timber, which includes site visits to importers of timber and verifying the origin of timber. Taking into consideration the above mentioned, the risk level for this indicator has been categorized to “low risk”.</p> <p>With focus on the local supply base, i.e. Latvia at the forest level, logging operations in most cases are carried out based on Harvesting permits and the requirements of the forest management plan. However, there are some specific types of harvesting where harvesting permits are not required and logging can be done without a harvesting permit (thinning works, maintenance of clearances, logging trees with diameter &lt;12cm, logging of deadwood and wind fallen trees) with subsequent provision of written notice to legal authorities. The Regulations on Harvesting in Forest defines information that shall be included in the Harvesting permit. Information contained in the Harvesting permit (place of harvest, forest property, and type of forest logging works, information on compartment and plot, harvesting area, contact details of forest owner etc.) allows the supply base to be tracked back to origin. In the case of feedstock harvesting outside forest land, a permission from the local municipality is required. Regulations on Logging outside Forest Land provides a general legal framework for harvesting outside forest lands. Regulations defines cases when a harvesting permit from the local municipality is not required, e.g. trees within protection belts, dangerous trees, trees threatening infrastructure, trees with stump diameter less than 20cm etc. In the latter case, the owner is required to provide declaration of origin of the feedstock, providing details on owner(s), property, land use type, harvested and sold volume of wood/feedstock. The current legislation states that Harvesting permits shall be kept 5 years by forest owners and the State Forest Service regional forestry, who is responsible for issuing the Harvesting permits. Law on Road Cargo and Value Added Tax states that physical and legal persons, transporting timber from private forests, shall have the timber transportation waybill referencing the origin of wood and with a reference to the Harvesting permit. The necessary information to be included in the waybill is defined in the mentioned legislation (contact information of supplier, receiver and deliverer, details about vehicle, the transportation place and time, tree species and volume, the place and time of deliverance). The mentioned legal acts allow linking transport documents, trade or export to the specific material in question and to the origin. The Road Police controls road cargo transportation with regard to implementation of the aforementioned legislation. The State Revenue Service controls implementation of legal acts related to the Value Added Tax.</p> <p>Taking into consideration the above mentioned, the risk level for this indicator has been specified as “low risk”.</p>
<p>Means of Verification</p>	<ul style="list-style-type: none"> <li>• Feedstock inputs, including species and volumes, are consistent with the defined Supply Base;</li> <li>• Felling Permits, transport documentation and goods-in records are consistent with the defined scope of the SBE;</li> <li>• Supplier audits for raw material origin</li> </ul>

	Indicator
1.1.3	The feedstock input profile is described and categorized by the mix of inputs
Finding	<p>The manager of state forests AS Latvijas Valsts Meži, municipal forest managers along with the majority of private forest owners does not process timber and sell only the primary products: round wood, fuel wood, chips, harvesting residues etc. The other forest owners such as the private forest owners or associations of owners may have their own timber processing facilities, however, they mostly sell primary forest products to other commercial entities. Regulations on round wood measurement and calculation set out the order on how the round wood is accepted (i.e. specify requirements for documents) and describe the rules of the documented timber tracking system and explain in detail, how the required documentation shall be filled in. Regulations apply to all physical and legal entities producing or selling timber products. Regulations on measurement and volume calculation of round wood and timber of standing forests defines the procedures, definitions, measurement methods, means and places of round wood and are obligatory for all forest owners, managers, traders and suppliers. The aforementioned legislation establishes systems that ensures the feedstock input profile is described and categorized correctly by the mix of inputs.</p> <p>(See indicator 1.1.2).</p>

<b>1.2.1</b>	The Biomass Producer has implemented appropriate control systems and procedures to ensure that legality of ownership and land use can be demonstrated for the Supply Base.
Finding	<p>In Latvia, the real property registration process is regulated by a number of Laws and Regulations. Tenure rights can be registered in land registry only if a natural person or a legal entity in any form provides relevant documents confirming the legal rights to the land concerned. This includes identification documents (passport, ID card, company registration documents, etc.), sales-purchase agreements, court decisions or other documents proving legal right to own real property. The main primary BPs in Latvia providing raw material for biomass production to other companies, are state forest enterprise AS LVM and private forest owners. State forest enterprise is entrusted to perform forest activities in state forests by the Decision of the Government in which the detailed information on state forests with exact boundaries is provided. The state forest enterprise is certified according to FSC/PEFC forest management and chain of custody standard in which the indicators concerning tenure, ownership and management rights and responsibilities are evaluated constantly. In over 10 years of the FSC certification process, no substantial issues concerning the violation of forest ownership and legal land use rights or any disputes over these rights in state forest were identified in state forests. In addition, state forest enterprises have the obligation to perform management rights (sanitation cuttings, etc.) in forests reserved for restitution. The land (forest) restitution process is still on-going. The process of forest restitution and establishment of legal rights including the provisions for solving disputes is clearly defined by legislation. Private forest ownership rights shall follow the registration process outlined in legislation and be registered in State Land Register (Zemesgrāmata). Every private forest owner shall have the forest estate plan and registration document.</p> <p>There is no evidence available to indicate that land rights happens in violation of the national legislation. There is no official information on cases of corruption involved in the process of issuing land tenure and management rights. The Latest survey (April, 2014 , <a href="http://www.knab.gov.lv/uploads/free/knab_if_aptauja2014.pdf">http://www.knab.gov.lv/uploads/free/knab_if_aptauja2014.pdf</a>) on corruption perception in Latvia organized by the Corruption Prevention and Combating Bureau</p>

	<p>(KNAB) shows that the State Land Service and the Land Register institution is among top 10 state institutions that the general public trusts the most (regards institution "fair" or "rather fair" in terms of corruption). Considering this and the current score on the Transparency International Corruption Perception Index (CPI=55, year 2015) the risk for this category is considered "low risk".</p>

	Indicator
1.3.1	The BP has implemented appropriate control systems and procedures to ensure that feedstock is legally harvested and supplied and is in compliance with EUTR legality requirements.
Finding	<p>Local legislation</p> <p>Local companies which market timber of local origin (in Latvia) do not need to carry out additional inspections of legality of the activity, as it is ensured in Latvia by tree cutting, nature protection, timber circulation and the requirements of the regulatory enactments regulating taxable activities. Nevertheless, the requirements of the Regulation and the checking for compliance applies also to timber produced in Latvia.</p> <p>Legislation regarding penalties and confiscation, covering all timber products as provided in the EUTR, is in place since 1st July 2015, while effective, proportionate and dissuasive penalties covering domestic production has been in place long before EUTR. Timber resource production in Latvia is carried out in accordance with the procedures stipulated in law. Timber harvesting is based on felling confirmation system. Felling confirmation specifies the type of harvest and is issued to a forest owner by the State Forest Service. Plus, once a year, the law requires forest owners or legal administrators to provide information to the State Forest Service regarding their commercial operations, including timber production and sales, which is also checked by the State Revenue Service. Furthermore, there is a law and regulations on the inventory of trees and round timber for regulating the procedures for record keeping in all stages of round timber circulation. Accordingly, based on Latvia’s national legislation, checks are carried out to verify the origin of timber, along with accounting transactions. In this way, for domestic production the requirements of EU Timber Regulation are met. Non-compliance with forest regulations, including illegal timber harvesting or transactions, can be punished with criminal sanctions laid down in State legislation, including criminal liability, fines and/or a prison sentence for negligence and acting against the law. The penalties and sanctions are considered to be robust, which is one of the reasons for the trends towards a reduction in illegal timber harvesting in Latvia over the past 15 years. Furthermore, the CA is constantly working on improvements of their audit system on locally harvested timber, which is based on risk analysis and includes large number of staff and large number of on-site visits and inspections.</p> <p>The CA is empowered to act, with a member of staff having been trained and dedicated specifically to EUTR. The CA is collaborating with other Member States’ Competent Authorities on risk assessment, equal enforcement and other issues. In Latvia, the CA cooperates with the State Revenue Service (Customs and Tax Control Departments), the Nature Conservation Agency, which is a CITES supervisory institution, and, when needed, other authorities. Information on all operators, placing timber and timber products on the market, is available to the CA.</p> <p>Specific training events about the EUTR for operators have not been carried out by the CA, but information has been clarified at meetings of the Latvian Forest Owners’ Association and Latvian Forest Industry Federation. Quality information has been provided and explained at seminars organized by monitoring organizations for individual merchants. The CA has a section on its website dedicated to the EUTR, it has developed guidelines for the operators, and it publishes information in timber industry magazines, as well as, in accordance with the EUTR, gives guidance to the operators on an individual basis.</p> <p>This category has been assessed as low risk.</p>
Means of Verification	<ul style="list-style-type: none"> <li>• National legislation;</li> <li>• Level of enforcement;</li> <li>• Supplier contracts with obligation to fulfil EUTR requirements;</li> <li>• Reference to sources of information in guidance notes;</li> </ul>

Risk Rating	<input checked="" type="checkbox"/> <b>Low Risk</b> <input type="checkbox"/> <b>Specified Risk</b> <input type="checkbox"/> <b>Unspecified Risk at RA</b>

	Indicator
1.4.1	The Biomass Producer has implemented appropriate control systems and procedures to verify that payments for harvest rights and timber, including duties, relevant royalties and taxes related to timber harvesting, are complete and up to date.
Finding	There are no specific forest harvesting fees such as royalties, stumpage fees and other volume based fees in Latvia. There are also no fees based on quantities, qualities and species. Applicable taxes related to all commercial entities in the forestry

sector are Corporate Income Tax, Value Added Tax, Personal Income Tax, State Social Security Obligatory Payments, Microenterprise Tax and Capital Increase Tax.

The Value Added Tax legislation specifies the rights, obligations and liability of tax authorities and taxable persons, as well as setting out the procedures for tax proceedings. Value added tax (VAT) must be paid by all persons (both natural and legal) with an annual turnover from their business higher than 50,000 EUR per annum.

State Revenue Service (Valsts ieņēmumu dienests) is responsible for the collection of VAT, which has to be declared every month by the tax payer. Since 2008, VAT for timber has been paid by the purchaser and not by the seller, in order to avoid VAT laundering. This significant change in VAT law promoted very good preventive measures to stop illegal activities related to VAT payments, contributing to a reduction of VAT laundering. If timber is sold by a natural person to a legal entity, that natural person is liable to pay income tax, which is 15% of the amount received. In this case, income tax on behalf of seller (physical person) is paid by the company, which is purchasing the wood. If wood is sold by an individual entrepreneur doing timber sales business, income tax is paid by that person once a year through income declaration process. Income tax declaration is coordinated by the State Revenue Service (Valsts ieņēmumu dienests). Declaration of income and payment of income tax is promoted by a possibility to get back part of the income tax declared, which gives an economic incentive to do so. Information about the tax payer is available online in the [Register of tax payers](#). In addition, it is possible to check legal entities on the website of the [State Revenue Service](#) for tax debts.

According to statistical data from the State Revenue Service, forestry sector accounts for 4.9% of all tax payers – commercial entities – legal and individual persons whose primary business is forestry or wood processing industry related. 26% of commercial entities working in the forestry sector are Value Added Tax payers. Of those 88% are legal entities and 12% microenterprises.

Forestry sector contributes 2.4% of all tax revenues, of these 60-70% is paid by commercial entities working in the forestry and logging sector, the rest is paid by the wood processing industry sector. There is high aggregation of tax payers in the sector, i.e. 2 tax payers (commercial entities) secure up to 70% of all tax revenues in the forest sector. Of those 1 tax payer in forest industry secures tax payment in 60% volume of total amount of collected taxes in forestry sector.

5% of the companies working in forestry (4% of total number of commercial entities) sector have signs of fictive companies. According to State Revenue Service, companies that have signs of fictive commercial entities has been relatively stable since 2010.

Observed situation with Obligatory social security tax and Personal income tax revenues show positive trends in the last years, which is explained by an increase in both number of workers and an increase in income in the sector after the financial crisis.

State Revenue Service analysis of the tax revenues, total tax and non-tax contributions in the forestry sector shows that there is a large proportion of taxpayers who receive a refund of the overpaid VAT in excess of their contributions by the budget. However, their share has been falling in last years.

The State Revenue Service points out a tendency of negative balance in undeclared VAT transaction sums in the sector - acquisitions indicated by taxpayers in tax declarations exceed acquisitions of the industry taxpayers declared as marketing (the total value of transactions). The value of undeclared VAT transaction sums has been increasing since 2009. The highest volume of undeclared VAT transactions is observed in the wood processing sector, where the increase in volume of undeclared VAT transactions have been increasing substantially since 2009. A small increase is observed in the forestry sector.

Payment of taxes and VAT in particular is closely related to the share of the shadow economy in Latvia. Recent studies show that the shadow economy in Latvia amounts

to one-quarter of the total economy. For example, according to the latest study (Shadow Economy Index in Baltic States 2009–2013, Stockholm School of Economics in Riga Sustainable Business Centre) the shadow economy index in Latvia accounted for 23.8% of the gross domestic product (GDP) in 2013. The index of shadow economy has decreased over the last three years, i.e. from 38.1% at the height of the economic crisis in 2010, to 30.2% in 2011, and 21.2% in 2012. The main driving forces behind the Latvian shadow economy is profit omission and tax avoidance ('envelope wages'), which remain major problems in the view of the authors of this survey.

The magnitude of the issue is characterised in State Revenue Service analysis of the forest sector. The analysis shows that between 30-40% employees in the forest sector receive the minimum wage or an amount that is below the minimum wage. The average level in the country is 23-25%. There is a small decreasing trend in the number of employees receiving the minimum wage in the last 3-4 years. The share of employees receiving the minimum wage is slightly higher in the wood processing sector. Wages that are comparable to the average level in the country employees receive 30-38%, which is below the national average (40%).

The risk of VAT avoidance is considered significantly higher for smaller companies and individual entrepreneurs, small forest owners.

The high share of the shadow economy and the issues with VAT, indicated by the State Revenue Service, "envelope wage" issue indicated by the high share of employees receiving minimum wage, are arguments in favour of "specified risk" designation for this category.

On the other hand, there are already mechanisms elaborated and implemented to combat tax evasion in the forestry sector, namely – reverse payment of VAT, relatively low threshold of Personal Income Tax; exclusion of Personal Income Tax from timber sales revenues that are invested in forest regeneration. 7.5% and 5% effective rates of Personal Income Tax for private forest owners are considered reasonably low to be motive of fraud in the view of interviewed stakeholders. These measures should provide reasonable incentive for forest owners to pay taxes. Additional argument to be considered as factor for risk minimization, is control over the measurement of roundwood by industry acknowledged independent 3rd party institution.

Additional arguments were provided by the Ministry of Economy and the State Revenue Service in relation to the latest initiative by the government with regard to combating the shadow economy.

A Shadow Economy Combating Council (SECC) is established at the Prime Minister's office. In June 2015 at a SECC meeting the Ministry of Finance (MoF) and the State Revenue Service (SRS) presented the government and social partners update on the progress of reducing the share of shadow economy made so far. The Action Plan (Plan) for limiting the shadow economy 2015-2020, containing measures on how to reduce the shadow economy in the country targeted to attaining level of shadow economy below the average level in the European Union by 2020.

The Action Plan sets target to reducing the share of shadow economy by 5% by 2020. The Plan contains an action plan for a number of areas of action:

- Tax collection promotion - a horizontal state administration priority;
- Complex solutions for rehabilitation of the shadow economy most affected sectors of economy. This includes implementation of special "Government shadow economy mitigation project" in sectors with the highest tax payment non-compliance;
- Change of morale of Tax payment through effective exchange of information, communication and education processes;
- Capacity building for the State Revenue Service and other institutions involved in enforcement of Tax legislation;
- Strengthening the dispute settlement (court) and penalty system;
- Improving the efficiency of tax policy.

The SECC and the government have come up with an initiative to set the limitation of the shadow economy as a horizontal priority for the government during preparation of the State Budget for year 2016. It has been agreed to provide maximum support to plans aimed at reduction of the shadow economy, in particular in the following priority in sectors such as construction, retail, wholesale, Public transport and services sector. Ministries and social partners have been asked to submit proposals on measures to combat the shadow economy until the end of June. The Ministry of Finance is responsible for compiling the submitted proposals and submission to members of SECC. The Shadow Economy Combatting Council approves the Shadow Economy Mitigation Action Plan 2016-2020 until August with specific tasks for ministries and social partners and decide on the further actions. During the preparation of the 2016 State Budget shadow economy mitigation measures planned for implementation from 2016-2018 shall be considered as a horizontal priority.

In addition to the Action Plan, the Ministry of Finance referred to the latest International Monetary Fund (IMF) Country Report 1(5/110, <http://www.imf.org/external/pubs/ft/scr/2015/cr15110.pdf>) for Latvia published in May 2015. The report points at tightening the labour market and an increase in wages in the country. Increase in wages in the assessment of IMF experts has been influenced by raising the minimum wage threshold and implementing successful tax compliance measures, which in the view of IMF experts have led to more accurate reporting and reduced the under-the-table “envelope wages”.

The State Revenue Service (SRS) provided additional information on measures that have already been taken to combat the shadow economy. The State Revenue Service is working to limit the 3 principal sources of funds for envelope wages: movement of unregistered money (cash), unpaid Income Tax and unpaid VAT. Principal sources of funding of envelope wages include: VAT refund fraud through non-existing deals; fraud related use of cash register, i.e. not using cash register; unjustified lending; unjustified advance payment issuance.

According to information from the State Revenue Service, SRS as of 2012 has initiated work in a number of areas as part of a program to combat shadow economy: excluding companies from the VAT tax payer register due to initiative of SRS, banning executives to take posts in companies; suspending companies business operations; terminating companies business operation; risk based approach in screening for physical persons and companies evading taxes. Quantitative results of implementation of the program have been provided and show that there are measurable results.

Since 2011, a four-fold increase in tax revenues has been registered. 2 times increase in individual entrepreneurs who have registered their business and became tax payers. The number of physical persons registered as commercial entities has increased two fold in 2013 in comparison with 2012. The number of legalized employees, who have switched from receiving “envelope wage” salaries to paying taxes have been steadily increasing from 4000 employees in 2011 to 14500 in 2013.

The State Revenue Service had come up with a number of legislative initiatives, which have been amended to existing legislation during the implementation of the shadow economy combatting program. Among the most important legislative initiatives proposed by the SRS the following can be considered:

- Limiting options for lending money for physical persons, stringent regulations for advance payments; established thresholds for lending amount to be notified to the State Revenue Service; advanced payments are treated as employment income and taxed if not settled within 90 days after issuance;
- There have been new stringent technical requirements established for cash registers and systems. New technical requirements allow State Revenue Service detecting unauthorized interference in cash or system software.
- Changes in public procurement legislation. Amendments allow exclusion of tenderer from a procurement procedure if the tenderer’s worker average monthly income in the first three quarters of the last four quarters period before filing date

is less than 80% of the average labour income in a given sector. Furthermore, average income level during the contract effectuation period shall not be lower than the national average income in the recent period.

- Amendments to crediting institution legislation obliges crediting institutions to notify the State Revenue Service for all physical person deals exceeding 36 000 € in year or every deal that exceeds 3 000 € in cash. State Revenue Service shall be notified for all individual transactions exceeding 20 000 € or cumulative sum exceeding 36 000 € during the year made using credit accounts registered in low-tax or tax-free countries.
- Crediting institutions are obliged to provide information to the State Revenue Service on physical person cash deposits to bank account, including those made through ATM. The credit institution shall notify the State Revenue Service for physical person deposits made to bank account not less than 8 times per year, for total amount at least 6 000 €. Also, credit and interest payments, exceeding total amount of 3 840 € per year shall be notified.
- Amendments to Criminal Code. In order to increase the efficiency of problem solving in relation to criminal offenses connected to “enveloped wages” the threshold for damages was reduced from 50 minimum wages to 5 minimum wages.
- Amendments to Administrative Penalty Code. As of 2014 employees hold the administrative liability for receiving “envelope” salaries, i.e. are working without an employment contract and evading Personal Income Tax and Social Security Tax.

The State Revenue Service has initiated a discussion for a number of new additional legislative initiatives to combat the shadow economy and “envelope wages” in particular. Among others it is proposed to begin a discussion on the following issues:

- to evaluate the option to levy penalties to taxpayers - physical persons who have registered commercial activity after the State Revenue Service reminder for obligation to register the economic activity;
- to evaluate the option to declare annual property status separately for set the types of information – types of property;
- to evaluate the option of applying new terminated tax levies with an aim to stimulate creation of new jobs and increasing salaries;
- review the base for personal income tax and the different application modes in order to optimize the current tax system, which allows for tax optimization capabilities.

Summary of the results of additional stakeholder consultations and implications to the risk assessment for indicator 1.4.1. There is no data available on the scale of shadow economy in the forestry sector. The government has launched a nation-wide, cross-sectoral program focusing on minimization of the share of shadow economy with aim of reaching average level of EU by 2020. The State Revenue Service had been implementing the measures to reduce the share of shadow economy scale since 2012. The State Revenue Service had initiated a number of amendments to legislation, which have proven effective results reflected in the statistics of results of the State Revenue Service.

Given the aforementioned, the positive trend in tackling the shadow economy issue in general and practical steps taken towards reducing the “envelope wage” problem by the responsible institutions – Ministry of Economy, Ministry of Finance and subordinated implementing agencies has to be acknowledged. The results of State Revenue Service in tackling the shadow economy, “envelope wages” in particular show progress. On the other hand, the overall scale of the shadow economy in the country and the “envelope wage” issue is highly relevant. Latvia is in the worst situation compared to neighbouring countries, Estonia and Lithuania. There is no direct link to the forestry sector, though as no detailed information on the “envelope wage” problem scale is available for forestry sector. The authors of the study on the shadow economy and the State Revenue Service consider following priority sectors of economy, characterized with highest share of shadow economy: construction, retail, wholesale,

	<p>Public transport and services sector. Forestry sector is not considered among the riskiest sectors.</p> <p>Given latest developments towards combating the shadow economy by the government, lack of data of contribution of the forestry sector to the shadow economy, positive trends in results of combating shadow economy by enforcing institutions, the risk level for this indicator is categorized as "low risk".</p>

	Indicator
1.5.1	The Biomass Producer has implemented appropriate control systems and procedures to verify that feedstock is supplied in compliance with the requirements of CITES.
Finding	<p>The Republic of Latvia has signed and ratified the Convention on International Trade in Endangered Species of Wild Fauna and Flora (The Washington Convention. 1973). In addition to the CITES convention, trade in endangered species of wild fauna and flora is regulated by a number of EU directives that extend the scope of species within the European Union.</p> <p>The rules for trade in wild animals regulating bringing into and taking out of the Republic of Latvia animals, parts thereof or articles made of them are prepared following the requirements of the CITES, provisions of Council Regulation (EC) No</p>

	<p>338/97 of 9 December 1996 on the protection of species of wild fauna and flora by regulating trade therein and Commission Regulation (EC) No 1808/2001 of 30 August 2001 laying down detailed rules concerning the implementation of the protection of species of wild fauna and flora by regulating trade therein. The procedure set by the above-mentioned regulations is to be followed and the licenses, certificates and other documents as specified in these Regulations are required on bringing in (taking out) animals and plants, parts thereof or articles made of them.</p> <p>The Nature Conservation Agency and the Customs are institutions responsible for implementation of CITES Convention requirements. Both institutions check import and export of endangered species under the CITES convention including timber product from protected species. CITES permit is required only when crossing the external borders of the European Union. A Special certificate is required when transporting particularly endangered species among the EU countries, in addition to legal origin certificate. These certificates, as well as a CITES permits are issued by the Nature Conservation Agency.</p> <p>An individual license issued by the Ministry of Environment of the Republic of Latvia must be presented for each consignment of animals and plants, parts thereof or articles made of them. On bringing of animals and plants, parts thereof and products made of them into/from Latvia to the third countries, the accomplishment of customs formalities is allowed only upon presenting the required licenses. Based on an annual report from Nature Conservation Agency of the Republic of Latvia in 2012, 10 persons were convicted for illegal importing and sales of CITES animals and plants, however, there is no information if these were related to animal or plant species.</p> <p>The risk can be considered as low for this indicator.</p>

	Indicator
1.6.1	The Biomass Producer has implemented appropriate control systems and procedures to ensure that feedstock is not sourced from areas where there are violations of traditional or civil rights.
Finding	There are no indigenous people in Latvia since Latvians are native people in their homeland. There are no communities whose livelihood depends on forest resources. Also, there are no groups of individuals having customary rights to forest harvesting activities. The Civil Code of the Republic of Latvia and Law on Forest defines principal legal framework for customary rights. Generally, the public has the rights to use forest non-timber resources. Customary rights to use non-timber forest products in nature conservation areas are regulated by special regulations allowing or prohibiting local communities to collect berries and mushrooms as well as fishing/hunting activities in particular area.
Means of Verification	Traditional and civil rights are identified; Procedures are in place to ensure rights are not violated.
Evidence Reviewed	<ul style="list-style-type: none"> <li>• <a href="#">Constitution of the Republic of Latvia (Satversme)</a>, "Latvijas Vēstnesis", 43, 01.07.1993., "Ziņotājs", 6, 31.03.1994.</li> <li>• <a href="#">Law on Forest</a>, "Latvijas Vēstnesis", 98/99 (2009/2010), 16.03.2000., "Ziņotājs", 8, 20.04.2000.</li> </ul>

	Indicator
2.1.1	The Biomass Producer has implemented appropriate control systems and procedures for verifying that forests and other areas with high conservation values are identified and mapped.
Finding	Information on location and geographical distribution of nature conservation areas, rare, threatened and endangered species and habitats can be considered sufficient and there are no major gaps in the knowledge on important nature conservation areas. Most important forest areas with high concentration of nature conservation values have been identified and designated as protected areas at national and/or EU level (Natura 2000 sites).  Forests in Latvia have not been examined fully for high conservation values (HCV), even though the major areas with high concentration of high conservation values have been identified and are covered by the network of protected nature areas with different protection regimes. Active survey and identification of Woodland key habitats and EU protected habitats has taken place in state managed forests, but there is not enough information on high conservation value forest (HCVF) localization in private owned, municipality and church forests, which constitute approximately half of the forests in the country.

For the current assessment the high conservation values are identified as follows:

**High Conservation Value Forests, category 1** – major locations of concentrations of species listed in the EU Habitat and EU Bird directive annexes are mapped and protected on national level through environmental protection and legislation. The current level of information on biodiversity is sufficient to identify most places where large concentrations of protected species are located. It can be stated that major sites of location of rare, threatened and endangered species are known, protected territories have been established and known.

There are 682 specially protected nature territories established in Latvia. The total area of protected nature territories constitutes 11.5% of total country area.

In 2004 when Latvia joined the European Union, network of protected areas of the EU importance Natura 2000 sites was designated in Latvia. As a basis for Natura 2000 network the existing national system of specially protected territories was used and amended. With introduction of Natura 2000 network, the total number of national specially protected territories increased from 576 (as of 2003) to 683 (as of 2016), 333 sites out of them having been designated or classified as Natura 2000 sites. (5th National Report to the Convention of Biological Diversity, Latvia 2014)

Natura 2000 sites in Latvia are designated for protection of 127 species and 60 types of habitats represented in Latvia and enlisted in the annexes of the Birds and Habitats directives. In particular, 22 plant species (genera), 34 invertebrates, 29 mammals, 14 amphibian and reptile, 13 fish species, and 58 habitat types included in the Habitats Directive's Annex II and 93 bird species included in the Birds Directive's Annex I are protected in the country within the Natura 2000 network. The Natura 2000 network in Latvia contributes to the conservation of five EU priority species and 19 EU priority habitat types as well as a number of other threatened, nationally protected species and habitats. (5th National Report to the Convention of Biological Diversity, Latvia 2014)

Micro-reserves are established both in specially protected areas and areas outside specially protected nature territories for protection of rare and endangered species and habitats. During the time period from 2001-2016, 2392 microreserves have been established covering 43 217 ha in total. 32% microreserves are established in specially protected territories and 68% - outside protected areas. Majority (87%) of microreserves are established in state/public land, but only 12% of microreserves are in private owned land. 9% of microreserves (by area) are targeted at protection of habitats, 91% - protection of species. 6% of microreserves are used for protection of forest habitats. (<http://www.daba.gov.lv/public/lat/iadt/>)

236 animal species, 426 plant and 62 fungi species are included in the list of specially protected species. 22 animal and plant species are included in the list of specially protected species with exploitation limits. In overall 2.7% from known species are included in the list of specially protected species. There are 86 protected habitat types in Latvia, 60 of them being of the EU importance (EU habitats).

Natura 2000 sites comprise 335.4 thousand ha of forests (11.3% of total forest area). In total various types of protected forests occupy 513.3 thousand ha or 17.5% of the total forest area. 17-84% of protected species are related to forests in every group of organisms on which information is available. There are 11 types of protected forest habitats in Latvia. (State Forest Service, Public report of 2015).

In Natura 2000 sites in Latvia, forests cover the largest proportion of territories and form the largest proportion of the habitat types included in the Habitats Directive's Annex I. These include priority habitats, such as Western taiga (9010\*), Fennoscandian natural old broad-leaved forests (9020\*), Fennoscandian deciduous swamp forests (9080\*), Tilio-Acerion forests on slopes, screes and ravines (9180\*), Bog woodlands (91D0\*), and Alluvial forests with *Alnus glutinosa* and *Fraxinus excelsior* (Alno-Padion, Alnion incanae, Salicion albae) (91E0\*). These forest habitats promote existence of large variety of biodiversity components including many rare, threatened species.

Several Natura 2000 sites in Latvia are essential for the conservation of threatened bird species that are almost extinct in many EU countries, with still large, though shrinking

populations. Thus, Latvian bird populations serve as donor populations for other parts of Europe. For example, about 5 % of the world and 8 % of the European population of black stork (*Ciconia nigra*) as well as 20 % of the world and 24% of European population of lesser spotted eagle (*Aquila pomarina*) occur in Latvia. Populations of mentioned species are noteworthy at the EU level. (5th National Report to the Convention of Biological Diversity, Latvia 2014)

In addition to mentioned protected territories, a BirdLife's International Important Bird Areas (IBA) needs to be mentioned as a known place of concentrations of rare, threatened and endangered species. There are 71 Important Bird Areas identified in Latvia by the Society of Ornithology of Latvia, 64 of those are inland territories comprising 8.3% of the country's land surface.

Important Bird Areas (IBAs) in Latvia have been selected for 59 wild bird species. 49 of these are listed in the Annex I of EC Birds Directive, the other 10 being regularly occurring migratory or wintering species. At least 17 more Annex I species occur in the identified areas. Most sites are qualified by occurrence of breeding bird species: 213 of 273 individual species records. (Račinskis E. 2004. Important Bird Areas of European Union importance in Latvia. Rīga, LOB)

Most of the inland IBAs in Latvia cover coastal lagoons, lakes, river flood-plains, large peatlands and fish-pond complexes or relatively plain forested areas. Almost half (44%) of IBAs are covered by forest habitats. All IBAs overlap to large extent with existing nature conservation areas (specially protected nature territories) and Natura 2000 territories. All IBAs overlap with existing 6 Ramsar Convention sites in Latvia.

One third IBAs in Latvia qualify on the basis of the population of a single bird species, and the majority of IBAs are important for one to three species (3-4 species on average). All IBAs have populations of 1 to 35 other important (Birds Directive Annex I) bird species regularly occurring in them, on average 15 species per site. (Račinskis E. 2004. Important Bird Areas of European Union importance in Latvia. Rīga, LOB)

Overall, national legislation and conservation measures provide adequate conservation safeguards for significant sites and territories of rare, threatened and endangered species; however, not all rare, threatened and endangered species may have adequate protection.

Information on RTE species protected territories, nesting sites and habitats, recognized and protected by national legislation, is cross checked during the processing for issuing felling permits against limitations of forest management activities held in the State Register of Forests (SRF) administrated by State Forest Service. However, given a number of important habitat sites, e.g., the nesting areas of a number of species included in the Bird's Directive Annex I, are not identified within the State Register of Forests this can result in forest management activities threatening the conservation status of many species through habitat removal and fragmentation.

Considering the facts above the risk for mapping of HCVF category 1 is designated as low.

**High Conservation Value Forests, category 2** – include high conservation value large woodland territories: UNESCO world heritage sites, Ramsar sites, forests in strict nature reserves, biosphere reserves, reserves of national or regional parks. Historical land use and forestry practices resulted that majority of present forests in Latvia are semi-natural ecosystems with small insertions of close to natural forests stands. No landscape-scale semi-natural forests with viable populations of most naturally occurring species exist in the country. Surveys show that in last centuries all Latvian forests were under various management activities varying from extensive to very intensive forestry with substantial land use change. First forestry practices were suspended in wetland forest stands situated around big bogs due to the establishment of strict nature reserves of big wetlands. In the 1970s, forestry practices were suspended in other valuable forests on account of creation of nature reserves. Six Ramsar convention sites are designated in Latvia. Other important areas for biodiversity of large areas include valuable forests in national parks, landscape protection areas and biosphere reserve. All of them are managed under nature management plans that contain provisions related to forest management. A majority of the important landscape level ecosystems are designated as nature conservation areas at

national level. The risk for this category is considered low due to the strong legal framework and existing network of nature protected territories.

**High Conservation Value Forests, category 3** – include Natura 2000 sites, EU protected habitats, Woodland key habitats.

Natura 2000 sites comprise 11.3% of total forest area. In total various types of protected forests take up 0.51 million ha or 17.5% of the total forest area. 17-84% of protected species are related to forests in every group of organisms on which information is available. There are 11 types of protected forest habitats in Latvia. There are no virgin forests in Latvia, remaining relatively small areas of old-growth forests are under strict protection, included in the strict reserves or strict reserve zones of nature protection territories. Representative samples of natural forest habitats and valuable ecosystems have been surveyed in state forests, identified and protected under Habitats directive (Council Directive 92/43/EEC on the Conservation of natural habitats and of wild fauna and flora) and designated as Natura 2000 sites. Natura 2000 sites overlap with national protected areas and are protected on national as well as international level. Semi-natural forest parcels with high biodiversity are identified as Woodland key habitats (WKH) and EU protected habitats. Aggregations of WKHs and EU protected habitats are designated in protected territories – nature reserves, national parks, landscape protection areas, biosphere reserve in national level or as Natura 2000 sites in EU level. However, there are areas of WKHs and EU protected habitats that are outside protected areas, particularly in private owned forests. According to current regulation forests areas within territory of Natura 2000 sites should be managed by both forest management and (or) nature management plans. At the moment, not all Natura 2000 sites have nature management plans. Therefore, the majority are managed only by general nature protection legislation or subsequently - forest management plans. Many WKHs and EU protected habitats have certain levels of protection either by falling inside Natura 2000 territory, or are voluntarily protected by certified forest managers. However, significant areas of WHK, particularly those located in non-certified forests do not have any protection status and there is a high risk of elimination of WKHs and EU protected habitats in non-certified forests. Given the above considerations the risk level for this subcategory is considered to be specified risk for non-certified forests.

**High Conservation Value Forests, category 4** – ecosystem protection forests and protection forests, i.e. forest areas important for securing basic environmental functions. National legislation contains provisions for protecting forests that are vital in protection of water resources e.g. the coastal protection zone along the Baltic Sea and the Gulf of Riga, protection belts along rivers and lakes, in protection zones around mires, protection belts around urban areas. Special regulations of forest management apply by limiting felling techniques to provide critical ecosystem services such as soil, air, water and man's living environment protection. Implementation of the forest law is provided through forest management plans, which are obligatory for all forest owners. The risk for this category is considered low due to the strong legal framework aimed at protection of ecosystem services through protection belt legislation.

**High Conservation Value Forests, category 5.** There are no indigenous people in Latvia since Latvians are native people in their homeland. Main necessities of local communities are related to recreation and mushroom and berries picking. These activities are important for many people for leisure or perquisite income. The right to free access to the state and municipal forests are guaranteed in the Constitution of Republic of Latvia (Satversme), The Civil Code of the Republic of Latvia, the Forests Law and other legal acts. With a few exceptions, all forests are available for berries and mushroom picking. Exceptions include strict nature reserves only. The right to free access to the state and municipal forests are guaranteed in the Constitution of Republic of Latvia and the Forests Law. The Constitution and Law on Forests allows forest owners to restrict access to the forest, and the Law on Forests outlines cases when access to forest can be restricted. Forest management does not play a significant role in relation to community necessities, because the Latvian forest cover half of the territory and various succession stage forests are present in the landscape, therefore no risk related to this sub-category exists.

High Conservation Value Forests, category 6. Forest and parks in or around objects of cultural heritage, for instance, manor parks, urban forests, forests of the important historical sites. There are numerous cultural areas and objects of cultural heritage associated with trees and forests. Some forests of cultural importance are inside cities, manor parks, urban forests and forests of the important historical sites. Cultural forests are owned by both the state and private owners. Such places are managed according to various different regulations and management plans. Historical places are managed under supervision of Cultural Heritage Inspection, urban forests and parks are managed by municipalities/local governments. A working database of cultural heritage value exists and all identified objects of cultural heritage are preserved through implementation of the Law on Protection of Immovable Cultural Properties. For example, about 150 objects of Cultural heritage – manors and manor parks, forests out of approximately 500 are protected by the Law on Protection of Immovable Cultural Properties. However, there are numerous old manor parks, dendrology plantations and pathways that have been established at manors and establishments associated with Baltic German culture, but many of them has been abandoned over the course of time and converted to forests. There is no information compiled on the cultural heritage of such forests and the actual cultural heritage status is not fully acknowledged.

Similar situation is with other objects and territories of cultural heritage, in private, municipal and church owned forests. The legacy of cultural heritage in forests is not fully known and there are gaps in knowledge. The outcomes of the cross-border cooperation project “Unknown cultural heritage values in common natural and cultural space” implemented jointly by the State Forest Service of Latvia and Estonian State Forest Management Centre and other partner institutions in administrative territories bordering both countries (in 74 parishes in Latvia) testify that there is large number of objects of cultural heritage values that have not been identified and registered. A detailed inventory of objects of cultural heritage values in 4 administrative regions (rajons) and 74 parishes (pagasts), has been carried out and 17 thousand objects were identified and brought to attention of historians within the project. In the view of specialists, the situation with gaps in knowledge in 4 mentioned regions can be extrapolated to the rest of the country, particularly those regions with high share of woodland areas.

**Non-forest lands**

Non-forest lands in the context of the risk assessment is considered agriculture land – partly or fully overgrown pastures, meadows, abandoned tillage. Economic activity in non-forest lands is linked with non-forest habitats – overgrown semi-natural grassland habitats in meadows and pastures. Tree and bush cover from overgrown agriculture lands is used for production of biomass – through removal of bush and subsequent chipping. Landowners typically carry out clearing of bush/shrub for purpose of agriculture land reclaiming, scenery/landscape improvement or energy biomass production – production of chips.

Meadows and pastures cover 1/3 of the agricultural land area in Latvia. A large part of agriculture land – both meadows and pastures as well as tillage were used intensively during the Soviet period and reversion for some period of pastures and meadows in arable fields was common. The reverse process began in 90ties when the intensity of agricultural activity decreased substantially and significant share of meadows and pastures were not utilised for agricultural purpose and began overgrowing with shrubs and trees.

According to recent statistical data from the Ministry of Agriculture, the area of overgrown agriculture land constitutes 260 thousand hectares. In the view of specialists, half of the overgrown area can be regarded as a forest land, i.e. the tree cover has reached the forest criteria and shall be managed according to forestry legislation.

Semi-natural grasslands which are a part of meadows and pastures are important from the biodiversity viewpoint as those represent one of most diverse and richest in terms of species habitat groups. About 40% of the rare and endangered plant species are dependent on habitats of grasslands. Many bird species nest and feed in grasslands. Semi-

	<p>natural grasslands cover 0.3% of the territory of country and the area is continuing to decline. Reports on the habitat status show that more than half of the EU important semi-natural grassland habitats in Latvia have an inadequate conservation status mainly due to lack of appropriate management. 13 grassland habitat types listed in the Annex I of EU Habitat Directive are found in Latvia (1630; 2130; 2330; 6110; 6120; 6210; 6230; 6270; 6410; 6430; 6450; 6510; 7210).</p> <p>Semi-natural grasslands – habitats that are listed in EU Habitat’s Directive Annex 1 have been inventoried in Latvia as Biologically valuable grasslands. There is elaborated mechanism for subsidies for farmers for the preservation of botanically valuable semi-natural grasslands (EU importance grassland habitats) and grasslands that are significant for grassland nesting birds that are registered in the Rural Land Register. The grasslands shall be managed by grazing or mowing. Cultivation, fertilization or spreading of manure is not allowed on these areas.</p> <p>The area of biologically valuable grasslands in Latvia is accounted for more than 65 000 ha, while only 50% of these areas are managed with help of subsidies. In expert opinion subsidies of Rural Development Programme are not sufficient to encourage landowners to resume the management of the grasslands, and that other methods should be sought out for maintaining of semi-natural grasslands.</p> <p>Removal of bush/shrubs in general is not considered a negative impact on the development and management of semi-natural grassland habitats, as it may facilitate the rehabilitation of grassland habitats in overgrown areas. Removal of bush is considered appropriate management method for many grassland habitats according to grassland habitat experts (Rūsiņa, 2016). However, a precautionary approach shall be used in situations when clearing is taking place in biologically valuable grasslands and special precautions shall be taken in using of forestry machinery to preserve the topsoil.</p>

	<p>4.1 If yes, go to 3.</p> <p>4.2 If no, the products cannot be sourced.</p>
--	---

	Indicator
<b>2.1.2</b>	<p>The Biomass Producer has implemented appropriate control systems and procedures to identify and address potential threats to forests and other areas with high conservation values from forest management activities.</p>
Finding	<p>There exists legal and institutional framework aimed at protecting the high nature conservation values in forests. The management of established protected nature areas is regulated by the Law on Protected Areas. Principal legal acts, which regulate the protection and management regime of protected areas, are: Law on Protected Areas, Regulations of individual protected area, the planning documents of individual protected area and the individual regulation of protected nature territory. The management of forests according to the Law on Forests is based on the forest management plan, which includes a special section on nature protection measures where the protected species, habitats and other environmental protection values or objects are listed, marked on the maps with prescribed and detailed protection measures. Forest management plans for private forest shall have the special part related to forest protection and implementation of requirements for environmental protection.</p> <p>The Law on Forests and subordinated normative regulations regulates harvesting depending on the management and protection regime assigned. Special regulations for forest management apply to forests by raising cutting age and limiting felling techniques to provide critical ecosystem services such as soil, air, water and man's living environment protection. The forestry operations shall be planned and implemented following requirements set up in the Regulations on tree harvesting in forest land. There are requirements for protection of nesting places of rare and endangered bird species as well as detailed requirement to leave trees and dead wood for biodiversity protection in logging sites.</p> <p>Information on rare, threatened and endangered species, protected territories, nesting sites and habitats (recognized and protected by relevant legislation) is cross checked during the processing for issuing felling permits against limitations of forest management activities held in the State Register of Forests (SRF) administrated by the State Forest Service. However, in absence of information related to given a number of important habitat sites, e.g., the nesting areas of a number of species included in the Bird's Directive Annex I, woodland key habitats and/or EU habitats this can result in forest management activities threatening the conservation status of many species through habitat fragmentation and removal.</p> <p>Intensive logging is linked to disturbance and loss of forest habitats of several rare, threatened and endangered bird species, particularly in areas important for bird breeding and nesting (Bird International, Important Bird Areas). Most of these areas are overlapping with existing nature protection territories, most of which are territories with less stringent nature protection requirements such as nature parks, protected landscape areas, National parks (except strict nature protection zoning), where active forest management, including harvesting in clear-cuts, is allowed. Thus, the actual protection regime in these territories in de-facto do not differ much from commercial forests outside protected nature territories where rare, threatened and endangered species and habitats are protected only through microreserves. The reduction of nature protection, biological diversity needs in favour of commercial interests can be linked to unfavourable status of protection of several rare, threatened and endangered forest bird species (black stork, lesser spotted eagle for instance).</p>

**High Conservation Value Forests, category 1**

With regard to identification and protection of conservation values there is an expert concern about nesting areas of a number of species included in the Bird’s Directive Annex I which are not identified and registered in the forest register databases and thus “de facto” are not protected outside protected nature territories with special protection regimes.

Of 28 forest bird species that are included in the list of endangered species for whom special protection measures needs to be envisaged, no protection measures are envisaged for 3 endangered bird species. In total, 21% of forest bird species are considered endangered. 7 forest bird species does not have protection status in the nature protection legislation and 2 endangered species are not on the list of bird species for whom the special protection measures (establishing protected territories - microreserves) shall be envisaged.

Bird population monitoring data shows substantial decrease in populations of two Bird’s Directive Annex I species – Hazel grouse (*Bonasia L.*) and Black woodpecker (*Dryocopus Martius L.*) over the last decade. Negative trends in populations of mentioned species has been observed already before in previous bird monitoring cycles. Both hazel grouse and black woodpecker conservation status in Latvian is regarded as unfavourable in view of nature experts. Hazel grouse and black woodpecker are settler bird species, so the decrease in population cannot be linked to quality of species habitats outside the country and other external factors, as may be the case of migratory bird species.

Furthermore, negative trends in population has been observed for 7 forest bird species. These include: lesser spotted woodpecker (*Dendrocopus minor L.*), whose population has been decreasing since 2009. Populations of species which currently does not have any protection status in Latvian nature protection legislation, i.e. Turtle dove (*Streptopelia turtur L.*), Tree pipit (*Anthus trivialis L.*), chiffchaff (*Phylloscopus collybita Wieill.*), willow warbler (*Phylloscopus trochilus L.*), marsh tit (*Parus palustris L.*) and common crossbill (*Loxia curvirostra L.*) has shown decreasing trend in last years. Hazel grouse, black woodpecker and marsh tit are species whose population data is used for calculation of Forest Bird Index. In the view of experts, decreasing populations of mentioned species indicate on deteriorating biological diversity in forest ecosystems (Monitoring report of 2014, Latvian Ornithological Society, Auniņš et al, 2014).

Furthermore, experts point on deteriorating situation with populations of two significant endangered species – black stork (*Ciconia nigra*) and lesser spotted eagle (*Aquila pomarina*). Forests of Latvia are very significant nesting area for about 5% of the world and 8% of the European population of black stork. The Latvian population of lesser spotted eagle accounts for about 24 % of the European population. The population of black stork according to studies in Latvia has decreased for approximately 45% from the initial population studies in the beginning of 90ties. Intensive forest management and deficiency of feeding sites are considered main factors contributing to decreasing population of black stork. Nesting areas of black stork are protected within specially protected territories and micro-reserves, however currently only 1/3 from all nesting areas are under legal protection. There is negative trend in overall development of population of lesser spotted eagle as well. The most important reason according to studies to that is intensive forest management particularly in non-certified forests leading to loss of old forest stands suitable for nesting.

There are reports on poor status of conservation status of protected nature territories. The conservation status of species and habitats in the EU Habitats Directive is periodically evaluated. The results of the last evaluation (year 2013) show that only 11% of habitats and 27% of species (other than birds) of the EU importance are in favourable conservation status in Latvia. (EEA-European Topic Centre on Biological Diversity, 2013).

Given the above mention information the risk for this sub-category is designated as “specified risk”.

**High Conservation Value Forests, category 2** – include high conservation value large woodland territories: biosphere reserve, Ramsar sites, and national parks. In addition to those, no landscape-scale semi-natural forests with viable populations of most naturally occurring species exist in the country. Other important areas for biodiversity of large areas

include valuable forests in national parks, landscape protection areas and biosphere reserve.

Mentioned High Conservation Value Forests are managed under national nature protection legislation and nature management plans that contain provisions related to forest management. A majority of the important landscape level ecosystems are designated as nature conservation areas at national level. The risk for this category is considered low due to the strong legal nature protection framework and existing network of nature protected territories. Given the above mention information the risk for this sub-category is designated as low risk.

**High Conservation Value Forests, category 3.**

According to current regulation forests areas belonging to Natura 2000 sites should be managed by both forest management and (or) nature management plans. Currently, not all Natura 2000 sites have nature management plans. Therefore some parts are managed according to general requirements for protection of nature conservation areas and forest management plans. Problematic areas in relation to threats to forests and other areas with high conservation values is nature values in woodland key habitats (WKH) and/or EU protected forest habitats. Some part of WKHs have a certain level of protection, because they fall inside Natura 2000 site, or by being voluntarily protected by forest managers that have implemented forest certification schemes. However, WKHs and EU protected forest habitats located in non-certified forests do not have any protection status. There is no detailed information on WKHs and EU protected habitats in non-certified forests that represent half of the forests in Latvia, because no full inventory has taken place. Forest habitats listed in EU Habitats Directive and woodland key habitats accounts to 7% and 3% of forest area in expert estimate. In expert opinion (Latvian Fund for Nature), at least 70% EU protected habitats and up to 35% woodland key habitats, totalling to more than 200 thousand hectares have not been mapped and are under threat of elimination. Furthermore, it is estimated that 70% of EU forest habitats are located outside the Natura 2000 territories. 57% of known woodland key habitats do not have any protection status in the State Forest Service Forest Register and forest management plans. (Larmanis, 2009)

Requirements to protect Woodland Key Habitats and/or EU protected forest habitats are not envisaged by current forestry and environmental legislation. In fact, forest owners/managers and logging companies lack knowledge and awareness on identification and protection of WKHs and EU protected habitats. Therefore, there is high risk that woodland key habitats and EU protected habitats are destroyed or damaged during harvesting operations in non-certified. Given the above mention information the risk for this sub-category is designated as specified risk.

**High Conservation Value Forests, category 4** – ecosystem protection forests and protection forests, i.e. forest areas important for securing basic environmental functions. National legislation contains provisions for protecting forests that are vital in protection of water resources e.g. the coastal protection zone along the Baltic Sea and the Gulf of Riga, protection belts along rivers and lakes, in protection zones around mires, protection belts around urban areas. Special regulations of forest management apply by limiting felling techniques to provide critical ecosystem services such as soil, air, water and man's living environment protection. Implementation of the forest law is provided through forest management plans, which are obligatory for all forest owners. The risk for this category is considered low due to the strong legal framework and implementation of legislation aimed at protection of ecosystem services through protection belt legislation. Given the above mention information the risk for this sub-category is designated as low risk.

**High Conservation Value Forests, category 5.**

Main necessities of local communities are related to recreation and mushroom and berries picking. These activities are important for many people for leisure or perquisite income. The right to free access to the state and municipal forests are guaranteed in the Constitution of Republic of Latvia (Satversme), The Civil Code of the Republic of Latvia, the Forests Law

and other legal acts. The right to free access to the state and municipal forests are guaranteed in the Constitution of Republic of Latvia and the Law on Forests. The Constitution and Law on Forests allows forest owners to restrict access to the forest, and the Law on Forests outlines cases when access to forest can be restricted. There is no information on large scale issues related to access of local communities to forest resources and use of these resources, therefore the risk level to this sub-category is designated as “low risk”.

#### **High Conservation Value Forests, category 6.**

Recognized objects of Cultural Heritage - Cultural monuments (cultural and historical heritage sites) are under supervision of State Inspection for Heritage Protection under the Ministry of Culture. A database on cultural heritage objects of national significance exists and these HCV 6 values are preserved by the law on Protection of Cultural Heritage. Forest areas with restrictions and limitations related to preservation of cultural monuments are also registered in the State Register of Forests (managed by the State Forest Service within existing forestry legal framework).

While it is true that known cultural heritage objects of national significance are protected by the law on Protection of Cultural Heritage; and there is a database of cultural heritage objects/monuments of national and local significance, there is, however, many objects of cultural heritage still unknown or little known to responsible institutions at national and even local municipalities at local level. Which in the opinion of experts presents risks to destruction or losing the quality of mentioned objects, particularly in private owned forests.

Experts are pointing on the fact that there are many unknown and unidentified objects of cultural heritage in forests. This can be supported by the outcomes of the project “Neapzinātās kultūras mantojuma vērtības kopējā dabas un kultūras telpā” (“Unknown cultural heritage values in common natural and cultural space”) implemented by the State Forest Service and Nature Conservation Agency Ziemeļvidzeme Biosphere reserve administration. Historical objects that are already protected by the State (burial grounds, mounds, settlements, manor houses, alleys), but whose precise location is not known were surveyed. The main focus of the project, however, was on identification of objects of historical evidence, which have not previously received attention of historians and landscape specialists - forestry history testimonies, such as lime kilns, ancient bridges and historic roads, stones and households, as well as other little-known historical attractions. Approximately 17 thousand different objects of cultural heritage significance were identified as part of the project activities in area covering 15% of the country area. Of those 40% constitute different kind of objects of cultural heritage value found in the forest land.

One of important object category is veteran trees. Data on trees with nature conservation value and cultural heritage value such as veteran trees is incomplete and covering only a fraction of what is estimated.

Currently nature data management system “Ozols” accounts information for about 5000 veteran trees, which correspond to the requirements for veteran trees designated in the national legislation. Nature Conservation Agency specialists estimate there are about 20 000 veteran trees in the country and only 1/4-1/5 has yet been identified and accounted for. Other experts (Dabas retumu krātuve) estimate the number of vetera trees to be exceeding 10 000. Outcomes of the project “Neapzinātās kultūras mantojuma vērtības kopējā dabas un kultūras telpā” (“Unknown cultural heritage values in common natural and cultural space”) coordinated and managed by the State Forest Service and implemented by several project partners – state institutions, academic institutions, non-governmental organizations identified 2.6 thousand trees with cultural heritage value and potential veteran tree status, of those 50% - in forest land (forests). The project focused on objects that were not previously identified and mapped and covered area of 15% of the total area of the country. Extrapolating this number to the whole territory of the country gives us approximate number of 17 thousand trees. From this one can assume only 1/3 of veteran trees could be currently registered and known to authorities and under effective protection.

Individual cases of veteran tree destruction are reported from time to time. The most scandalous recent case is cutting of Pētermuiža northern white Cedar (*Thuja occidentalis* L.) in Valle parish, Vecumnieki region, which was the 2nd largest diameter veteran northern white Cedar in Latvia. The tree was in good condition and neither the harvesting company nor local municipality were aware of the status and nature conservation value of the tree.

There is no statistical data regarding the condition of veteran trees available. Condition of identified veteran trees was registered in the project “Neapzinātās kultūras mantojuma vērtības kopējā dabas un kultūras telpā” (“Unknown cultural heritage values in common natural and cultural space”). Analysis of the database shows of veteran trees identified, 0.5% have been damaged to full extent – destroyed, 3.4% - heavily affected/transformed, 19% - substantially affected/damaged and 77% - in satisfactory condition.

Objects of cultural heritage related to the scope of the SBP risk assessment study include also old manor parks, dendrology plantations and alleys attributed to the Latvian and German Baltic culture of 19th century as well as other objects of cultural heritage.

There are numerous manor parks, demonological plantations. Some of old manor parks and demonological plantations have been abandoned and subsumed by forests that could be potentially considered sites of national or local level cultural, archaeological or historical significance, particularly in private forest areas. Those can occur in forest lands, overgrown agriculture lands that may or may not have forest land status, also in agriculture and other land use types. These heritage forests/stands are composed of local deciduous tree species as well as other non-local (exotic) deciduous tree species in occasions. Mentioned forest stands and demonological planted pathways/alleys are usually more than 100-150 years old, attributed to Baltic German manor culture. There is however limited information available on the values of cultural heritage on such areas/sites and thus the status of these potential cultural and historically valuable sites may be unknown.

Alleys and demonological pathways are considered unique element of the rural landscape in the country. There is legal framework established for protection of alleys that are considered protected and included in the list of protected alleys. The protection status is not considered sufficient though. According to the information from Dendrology society, of 300 alleys inventoried and recognized as unique at national level in early 2000s, however only 60 are included in the list of protected alleys and protected at national level.

The protection status of alleys not included in the list of protected alleys in non-forest lands is insufficient according to evaluation of in-house experts. Current legislation gives power of decision to self-governments whose approval is needed to approve cutting of trees outside forest lands, which is the case of alleys. In many cases local municipalities have issued cutting permits to remove alleys along the roads which has raised protests from local communities. This is the case also for private forest owner who need to get approval from the local municipalities to cut trees in non-forest land.

Mass media are regularly reporting on cases of cutting of alleys and protests of local inhabitants and local communities. There are at least 20 known highly resonated cases of cutting of road alleys that are important to local communities and even at national level during the last decade. The most prominent and scandalous cases can be mentioned cutting of Vīceži ash alley stand (Lībagi parish), ash alley in Nīkrāce, Pāce street linden/lime tree alley in Dundaga, Limbaži-Dūči road alley in Limbaži parish, destruction of oak alley (destruction of more than 50 oak trees characteristic to rural landscape in Vidzeme) in Kaive parish, which have raised protests from local communities. There have been cases of protests of local communities for cutting of alleys in recent years too.

In addition to issues of identification and registering of objects of cultural heritage (both national and local significance) mentioned above, there are reports on capacity of the enforcing institutions in the field of protection of cultural heritage (objects). A recent (2016) State Audit Office (Valsts kontrole) revision report on the implementation of policy of protection of cultural monuments (report “Does cultural monument policy in Latvia ensure the protection of cultural monuments?”) (<http://www.lrvk.gov.lv/revizija/vai-latvija-planota-un-istenota-kulturas-piemineklu-aizsardzibas-politika-nodrosina-saglabasanu>) brings

	<p>attention to a number of issues in relation to capacity and efficiency in protection of known objects of cultural heritage – cultural monuments.</p> <p>One of main conclusions by the State Audit Office is that the State Inspection for Heritage Protection under the Ministry of Culture does not follow up planned and consecutive activities to prevent the destruction of cultural and historical values and the monitoring and supervision of cultural monuments conservation status is not sufficient.</p> <p>Inspection’s work regarding inclusion of culturally significant objects in the list of monuments is not systematic. The State Audit Office brings attention to untermiated (long) time frame for reviewing the application for inclusion of objects of cultural heritage in the list of protected cultural monuments thus presenting a risk to lose the cultural and historical value. The report is pointing on the absence of list of objects of potential cultural importance, lack of a procedure and time limits it reviewing and considering the objects for protection.</p> <p>It is pointed out in the report that activities undertaken the by Inspectorate are not sufficient to attain the target of the Law on Protection of Cultural Monuments - to retain the heritage value and prevent the destruction or loss of cultural heritage value of identified cultural monuments. There is risk in view of the State Audit Office that objects of cultural heritage value are not classified correctly with regard to importance for monitoring and inspection and cultural monuments under threat are inspected too seldom.</p> <p>Considering the aforementioned information, it can be concluded that there is a risk of damaging and/or destruction of high conservation values under this sub-category, the risk is designated as “specified risk”.</p> <p>The specified risk designation is largely based on the facts that there is information on isolated cases of destruction/damaging of objects of cultural heritage in private forests that do not have official protection status; the general opinion of stakeholders regarding unawareness of private forest owners of the cultural heritage values in their forests, negligence of harvesting companies with regard to preserving of objects of cultural heritage, unwillingness of private forest owners to communicate/notify authorities about objects of cultural heritage in their forests due to fears of restrictions for tree harvesting.</p>

Risk Rating	<input type="checkbox"/> Low Risk <input checked="" type="checkbox"/> Specified Risk <input type="checkbox"/> Unspecified Risk ar RA
Comment or Mitigation Measure	<p>The specified risk is assigned for this indicator in relation to protection of high conservation values such as Woodland Key Habitats, EU protected habitats, forests with social and cultural values and others in non-certified forest areas, against negative impacts of forest activities. The proposed controlled measures include an option for BP to utilize available information resources in order to check if the coming material is not sourced from areas containing high conservation values.</p> <p>See also the control measures in 2.1.1</p>

	Indicator
2.1.3	The Biomass Producer has implemented appropriate control systems and procedures for verifying that feedstock is not sourced from forests converted to production plantation forest or non-forest lands after January 2008.
Finding	<p>According to the Law on Forests, the forest is defined as a tract of land no less than 0.5 ha, covered by trees or other forest vegetation or temporary loss of it (cleared or burned areas). According to Regulations on reforestation and planting plantations it is defined as special purpose of one tree or bush species plantations grown for special purpose. According to the Law on Land, forest land includes land covered with forest (forest stands), non - forested area (clear cutting area, damage forest stands, open forest area, forest nurseries, forest seed orchards, raw bush area and plantations), area comprising of forest roads, forest compartments, technological and fire prevention borders, area of forest yards, recreational yards, game feeding sports and land assigned for afforestation as well as fragments of other land use purpose inside of forests. The conversion of forest land into other categories is strictly regulated by national legislation and is allowed only in clearly defined exceptional cases. The main legal acts dealing with conversion of forest land into other categories are as follows: The Law on Land, The Law on Territory Planning, The Law on Forests, The Regulation Procedures of the Conversion of Forest Land into Other Categories and Compensation for the Conversion of Forest Land into Other Categories. Converting forest land into other categories is prohibited in protected territories such as forest reserves, forests for protection of ecosystems, protection belt forests (Baltic Sea and Riga Bay), forests of protective zones in state parks and other forests categories mentioned in the Law on Forests (for details, please see the source information).</p> <p>The conversion of forest land into other land use categories is regulated by existing legal territory planning and forestry framework.</p> <p>The conversion of forest land into other categories is allowed only in few exceptional cases: if deforestation is necessary for the construction, mining, establishing agricultural land; and restoration of specially protected habitat restoration. The conversion may take place if the person initiating conversion has been issued an administrative act, which gives it the right for those activities, and the person pays state compensation for adverse effects associated with deforestation. The owner of the land is obliged to pay state compensation for deforested land, if the land use type in National Cadastre Information System is established as forest. The compensation includes fees: 1) for loss of carbon dioxide sequestration potential; 2) for the loss of biodiversity; 3) for degradation of environmental and natural resource protection and sanitary functions.</p> <p>The State Forest Service periodically controls the application of forestry and territorial planning regulations related to deforestation and compiles statistics. Statistical data shows that there are about 20-30 cases of violation of forestry law regarding deforestation. Violation cases are typically of small magnitude ranging from a few cut trees along the construction site to deforestation in small area and following transformation into building, ponding or other land use types. There is no information on large scale illegal transformation of forest land.</p> <p>The risk can be considered as low for this indicator.</p>

	Indicator
2.2.1	The Biomass Producer has implemented appropriate control systems and procedures to verify that feedstock is sourced from forests where there is appropriate assessment of impacts, and planning, implementation and monitoring to minimise them.
Finding	<p>The Law on Environmental Impact Assessment of the Proposed Economic Activity defines the procedures, responsible institutions and provides the list of specific activities for which the defined environmental impact assessment shall be performed. The separate section of activities related to the forest sector, for which the environmental impact assessment shall be performed, is defined, in case of afforestation or forest cutting with the aim to change the land-use type (if proposed activity exceeds more than 50 ha). The Law on Environmental Monitoring specifies the content, structure, implementation of environmental monitoring, the rights and duties as well as responsibility of the entities participating in the process of environmental monitoring. The main planning document where the assessment of impacts, and subsequent planning, implementation and monitoring are defined for forest owners, is the forest management plan. The Regulations on preparation of forest management schemes and forest management plans defines the procedures for preparation, approval, update, and registration, content and quality review of forest management plans for both – state and private forest owners. Forest management plans include analyses, monitoring results and the description of management impact of previous period. During the preparation process of a new management plan all relevant data shall be collected and together with analyses of previous management cycle shall be fed back into new management plan and consequently into operation practice. In addition, state forest enterprise AS LVM has developed own environmental impact assessment procedures for activities, which could have negative impact to environment, for instance: road reconstruction, drainage, the</p>

	<p>construction of gas or electricity lines etc. There is the prevailing practice to include in the agreements with contractors the requirement to inform the forest owner about observed potential negative impacts of forest operation to biodiversity and ecosystems and to take preventing measures to avoid or minimize it. In addition, the check up of forest area before cutting is constantly performed by state forest officials in state forests.</p> <p>Control on how forest operations in felling areas are being or have been implemented according to requirements existing legal and normative acts is carried out. The State Forest Service has the annual control plan. There are environmental NGO's that are periodically undertaking monitoring of several aspects of forest operations impact to environment or carries out different inventories or monitoring projects. The monitoring results in the form of reports, project results, national forest inventory, and statistical data are available at responsible institutions, for instance: <a href="#">State Forest Service</a>, Ministry of Agriculture etc.</p> <p>All FSC/PEFC certified forest enterprises constantly evaluate and address FSC standard indicators related to monitoring (FSC Principle 8) and environmental impact assessment (FSC Principles 6,8,9).</p> <p>The risk can be considered as low for this indicator.</p>

	Indicator
--	-----------

<p>2.2.2</p>	<p>The Biomass Producer has implemented appropriate control systems and procedures for verifying that feedstock is sourced from forests where management maintains or improves soil quality (CPET S5b).</p>
<p>Finding</p>	<p>Special regulations on environment protection in forest management defines the principal requirements for the protection of ecosystem services such as soil, air and water. Environmental protection Regulations on forest felling contains regulations for soil protection, i.e. the forest manager is obliged to maintain forest function of preventing soil erosion. The maintenance of buffer zones along watercourses or open areas as well as some limitation in relation to protection of soil against erosion is foreseen in the Regulations on forest felling. Legislation also contains criteria to assess the soil damage caused by forestry machinery Forest managers shall take into consideration the terrain and soil properties in soil preparation for forest regeneration as well as during timber harvesting and forwarding works. However, no explicit requirements for soil protection (limitations for tree felling on slopes, ravines etc.) are provided in the national forestry legislation.</p> <p>The management of Latvian forests according to the Law on Forests is based on a forest management plan, which includes the special section on nature protection measures where the protected species, habitats and other environmental protection values or objects are listed, marked on the maps with prescribed and detailed protection measures. The Forest management plan have the special part related to forest protection and implementation of requirements for environmental protection.</p> <p>In addition, the Forest management plan, the planning documents of individual protected areas, the individual regulation of protected objects or selective areas, defines the requirements and procedures to prevent the soil damage, for instance seasonal limitations to felling etc. Harvesting activities in protected areas shall be agreed with relevant authorities (state or regional park administrations, Nature Protection Board, protected areas authorities etc.).</p> <p>Environmental requirements applicable to forestry are listed in Forestry and Nature Conservation laws and related normative legal acts. The State Forest Service and Nature Protection Board are institutions responsible for controlling of fulfilment of these laws. The main environmental issues reported by controlling institutions are forest soil damage, damage by game, uncontrolled waste dumps. The State Forest Service periodically controls the implementation of legislation targeting protection of natural values, objects and protected areas. Annual reports show that identified violations of environmental protection regulations in forest management comprise a minor share of total cases. Environmental violations comprise 5% of the total number of violations of forestry-related legislation (up to 52 cases per year in the last four years). There is a trend of an increasing number of cases of violation of environmental requirements in the last two years (30 and 52 cases in 2012 and 2013, compared to 9 and 13 cases in 2010 and 2011, respectively).</p> <p>According to the studies on impact of forestry machinery to forest soils commissioned by the state forest enterprise AS LVM operation of forest forwarding machinery is causing the biggest impact on forest soils. Soil compaction caused by forwarding machinery in forwarding tracks in the plot is estimated to be 3 to 4 times greater than those from intact plot areas. Soil compaction is more influenced by the harvesting season than a type of forestry machinery. No substantial differences in regrowth quality have been observed in technological tracks and intact forest area. Also, no substantial differences have been observed in tree dimensions and species composition. Some species, however, show better growth conditions in forwarding routes/technological tracks. The density of trees is impacted substantially by soil compaction according to the outcomes of the study.</p> <p>The state forest enterprise AS LVM has developed recommendations (best management practice guidelines) for reducing negative effects on soil quality.</p> <p>Based on the reports produced by the above-mentioned authorities, no systematic and/or large-scale non-compliance with legally required environmental protection measures to an extent that threatens the forest resources or other environmental values have been</p>

	identified. The magnitude of environmental issues, soil in particular is considered of limited scale and is not considered a specified risk.

	Indicator
2.2.4	The Biomass Producer has implemented appropriate control systems and procedures to ensure that biodiversity is protected (CPET S5b).
Finding	<p>Depending on the management and protection regime of a particular forest territory harvesting is permitted. The management of established protected areas is regulated by the Law on Protected Areas. Main legal documents that regulate the protection and management regime of protected areas, are Law on Protected Areas, Regulations of individual protected area, the planning documents of individual protected area, and the individual regulation of protected objects or selective areas. The management of forests according to the Law on Forests is based on forest management plan, which includes the provisions for nature protection measures where the protected species, habitats and other environmental protection values or objects are listed, marked on the maps with prescribed and detailed protection measures.</p> <p>The statistical information on Latvian protected areas, rare and endangered species found in Latvian forests and other relevant data can be found in the website of the <a href="#">State Forest Service</a> and <a href="#">Nature Protection Board</a>. The Regulations on preparation of forest management schemes and forest management plans states that forest management plan for state forests shall include sections related to forest protection against fires, sanitary protection, and biodiversity protection, recreational and social functions of forests. Forest management plans for private forest have parts relating to forest protection and implementation of requirements for environmental protection, having obtained existing data from the environmental institutions and/or managing authorities of protected areas. The forest operations shall be planned and implemented while following the requirements set up in the Regulations on Forest Felling. There are provisions in the mentioned regulations for seasonal harvesting operations, i.e. some final felling and thinning works are not allowed from 1st April until 1st of July. There are requirements for protection of nesting places of rare and endangered bird species as well as detailed requirement to leave trees and dead wood for biodiversity protection in logging sites. The maintenance of buffer zones along watercourses or open areas as well as some limitation in relation to protection of soil against erosion is foreseen.</p> <p>Forest management plans are prepared for a 20-year period and include analysis and a description of the management impact in the previous period. During the preparation process of a new management plan all relevant data shall be collected and together with analyses of previous management cycle be incorporated into the new management plan and consequently into the operation practice. Nature protection data from state institutions are used in preparation of forest management plans. In case the forest property is located within territory with a nature protection status, the forest owner shall consult the managing authority of nature protection territory.</p> <p>The State Forest Service periodically controls how the application of legal acts targeted to protection of natural values, objects and protected areas are implemented.</p> <p>Maintenance of forest biological diversity is affected by economic situation in the countryside according to the outcomes of the report (5<sup>th</sup> National Report to the Convention on Biological Diversity). The report outlines the fact that forest often is seen as the only income for inhabitants of the countryside, which contributes to unsustainable use of forests. Other factors that impact the forest biodiversity negatively are: melioration, construction of forest roads, lack of natural disturbance in particular forest habitats.</p>

	Indicator
2.2.5	The Biomass Producer has implemented appropriate control systems and procedures for verifying that the process of residue removal minimises harm to ecosystems.
Finding	<p>The forest operations shall be planned and implemented following the requirements and procedures set in the Regulations on Forest Felling. Regulation of Felling on Forest contains technological requirements for logging site preparation and logging, but no particular requirements for removal of harvesting residues is foreseen in the national legislation at the moment. Harvesting works in protected areas shall be agreed with relevant authorities (state or regional park administrations, protected areas authorities, etc.). Before harvesting the preliminary environmental impact assessment shall be carried out by foresters in state forests and preventive measures selected.</p> <p>There are no provisions related to extraction of biomass/feedstock to protect ecosystems, for instance limitations for the time and the season for extraction according to forest site type, the use of skidding roads, places to store biomass, ban to burn biomass in forests and extraction from certain forest site types (those growing in poor mineral soils) etc. Similarly, no such provisions are included in state forests managing enterprise AS</p>

Latvijas Valsts Meži procedures and best management practice guides. There are no scientific studies or results showing negative impact of biomass – logging residues removal from forests. However, opinion of forest scientists in Latvia is outlined in few reports.

Felling residues should not be removed in certain forest site types such as SI (*Cladinoso-callunosa*), Ln (*Myrtillosa*) and Mr (*Vacciniosa*), to avoid depletion of soil humus according to authors of study on impacts of forestry machinery on forest soils ( *Meža apsaimniekošanas tehnikas un tehnoloģiju ietekme uz augsnes īpašībām*, Silava 2004).

The report (*Biomazas izmantošanas ilgtspējības kritēriju pielietošana un pasākumu izstrāde: Meža biomasas resursu izmantošanas analīze, novērtējot dažādu mežistrādes etapu varbūtējo ietekmi uz bioloģiskos daudzveidību*, VSIA Vides projekti, 2009) concludes that more research work on effects of logging residue extraction needs to be done to evaluate the potential impacts of thinning works. Until then it is recommended to extract biomass harvested only in areas with very fertile soils, during the winter period, without strain removal. It is also necessary to continue research work in assessing the ecological role of ecological trees in a forest sustainability context in order to determine the good practice for the extraction of biomass from forest stands in Latvian situation. As a part of good practice recommendation, it is suggested that logging residuals are not collected in forest site types with low fertility soils, regardless of the composition of soil and moisture conditions. Economic aspects should favour this due to relatively small amount of logging residues present in stands growing on poor soils and higher costs for feedstock extraction and transport. The authors conclude that the current legislative provisions as well as certification and best practice recommendations does not jeopardize saprophytic and associated species living environment upon removal of feedstock from the forest.

With regard to harvesting residuals, national legislation requires removing felled green unsound spruce wood (dumped, broken trees and a large logging residues (10-50 cm in diameter) from the logging plot to limit spreading of root rot fungus (*Heterobasidion annosum*).

The monitoring data and forest inventory records of the last decade indicates that the total forest coverage has increased, the harvesting rate was lower than the forest increment and the data about structure of forest stands according to forest sites does not show the tendency of increase of poor forest stands.

Given the lack of provisions in the legislation and best practice recommendations, there is a risk that felling residues are extracted for feedstock purpose from all forest site types, including those occurring on poor mineral soils, oligotrophic/oligomezotrophic sites, such as SI (*Cladino-callunosa*), Mr (*Vacciniosa*), Gs (*Cladinoso-sphagnosa*), Mrs (*Vacciniososphagnosa*), Pv (*Sphagnosa*), Av (*Callunosa mel.*), Am (*Vacciniosa mel.*), Kv (*Callunosa turf. mel.*), Km (*Vacciniosa turf. mel.*) Thus, the risk for this category is proposed to be “specified” for discussion in stakeholder consultation process.

During the stakeholder consultations process it was discussed that the risk level for this indicator shall be considered “low” due to the following information. Forest site types located on poor soils occupy approximately 10% of the total forest area in the country. Half of it (5%) constitute wet forest site types. In case of wet forest site types, harvesting residues are used for stabilization of technological tracks and there is no threat to forest ecosystem from harvesting residue removal. In case of dry forest site types stakeholders pointed out the low amount of harvesting residues in the mentioned forest site type and the low motivation for forest owners to collect harvesting residues as a biomass feedstock. Low motivation is stipulated by high costs of forwarding and economy of operation of mobile chipping equipment. In addition, there are provisions in the national legislation to retain deadwood in the plot, which has to be followed by the forest owner/logger. Stakeholders agree that thinning works do have negative effects, but the share of thinning in total harvesting volume is considered too small (ca 20-25%) to consider the level of risk to be specified. The reason for this is a very small share of thinning on forest site types growing on poor soils with very small density and volume and it is therefore considered that there is a very low incitement for removal of residues.

	Although there is no regulatory requirement to limit the extraction of biomass from forest site types on poor soils, stakeholders do not see risks associated with extraction of biomass from forest site types in poor soils. Therefore, the risk level for this indicator has been designated as “low risk”.

	Indicator
2.2.6	The Biomass Producer has implemented appropriate control systems and procedures to verify that negative impacts on ground water, surface water and water downstream from forest management are minimised (CPET S5b).
Finding	The Law on Protection Belts and the Law on Forests (Nature Protection Regulations) contain requirement for protection of water resources, including surface watercourses in forests. One of the function of protective forests is to maintain the water protection functions of the forests. The special management regime is set in forest management plans or management documents of protected areas where these forests are located in order to protect water bodies from damage, pollution, etc. The maintenance of buffer zones along watercourses or open areas is foreseen in the Regulations on Forest Felling. Forest felling targeted to maintain biodiversity and to regulate special areas around water courses are defined in the Regulations on Forest Felling. Regulations on evaluation of compliances of tractors, its trailers and other machines in agriculture and forestry set the requirements for forest machinery in order to prevent possible damages to environment, including watercourses. In addition, the Regulations on Forest Felling defines

	<p>requirements for preparation for forest felling, use of skidding roads, use or temporary bridges or mats for stream crossing etc. to protect soil and water streams.</p> <p>Technological maps require to provide information on technological tracks, including information on log stacks, water course crossings etc. The common practice for forest managers is to inspect the logging site together with the contractor in order to evaluate the harvesting conditions area and discuss and agree on the use of forest felling techniques, taking into account the special conditions of felling areas, including protection of water streams by avoiding to use forest technique around it, to distribute technological tracks etc.</p> <p>The State Forest Service periodically controls for compliance of legal acts targeted to protection of natural values, objects and protected areas. In addition, the regional offices of Environmental Protection Agency periodically control the management and application of legal requirements for environmental protection. The information on violations are compiled in annual report available at the website of the <a href="#">State Forest Service</a>. Reports of the State Forest Service shows that there is no substantial, systematic and/or large-scale non-compliance with legally required environmental protection measures to an extend that threatens the forest resources or other environmental values. Annual reports show identified violations of environmental protection regulations in forest management comprise a minor share of total cases. Environmental violations comprise 5% of total number of violations of forestry related legislation. There have been up to 52 cases per year in the last four years. However, there has been an increasing trend in cases of violation of environmental requirements in the last two years (30 and 52 cases in 2012, 2013 compared to 9 and 13 cases in 2010 and 2011). Based on the reports produced by the mentioned authorities it is evident that there is no systematic and/or large-scale non-compliance with legally required environmental protection measures to an extend that threatens the forest resources or other environmental values. The magnitude of environmental issues in forestry is considered of limited scale and is not considered as specified risk.</p>

	Indicator
2.2.7	The Biomass Producer has implemented appropriate control systems and procedures for verifying that air quality is not adversely affected by forest management activities.
Finding	<p>The Law on Ambient Air Pollution regulates the protection, management and monitoring of ambient air pollution. There is no indication of any damage of influence to air quality of forest operations. There is no information if the forestry activities/operations has impact on air quality. The air quality is influenced by biomass/feedstock users, burning biomass in the power plants, households or other facilities. The monitoring and statistical data on air quality and air quality trends is available at the website of the Latvian Environment, Geology and Meteorology Agency. Regulations of Forest Felling clearly define a ban on burning of biomass in the forests and the implementation of the requirement is controlled by the state institutions. The requirements for forestry machinery are defined in the Regulations on evaluation of compliances of tractors, its trailers and other machines in agriculture and forestry, which defines the standard for forest machinery in order so it will not cause damage to environment. The Latvian Environment Geology Meteorology Centre (LEGMC) is the institution responsible for ambient air monitoring. The monitoring procedures, functions and observation data and monitoring results are available on the website of LEGMA.</p>

	Indicator
<b>2.2.8</b>	The Biomass Producer has implemented appropriate control systems and procedures for verifying that there is controlled and appropriate use of chemicals, and that Integrated Pest Management (IPM) is implemented wherever possible in forest management activities (CPET S5c).
Finding	<p>The Law on Plant Protection outlines procedures for plant protection product registration, import, use, storage and protection measures, as well as informing the public and control of the use of pesticides and other chemicals for plant protection purpose. Cabinet of Ministers Regulations Nr. 264 “General Regulations on Protection and Use of Specially Protected Nature Territories” prohibit using plant protection products (pesticides) in forests in territories with any of protection status. All plant protection products shall be registered according to defined procedures. Information about registered plant protection products can be obtained on-line in the website of the State Plant Protection Service. The list of the plant protection products that are allowed for use in forests is available in the website of State Forest Service. The Plant Protection Service under the Ministry of Agriculture is responsible for registration, control and legislation enforcement of the plant protection products. The use of chemicals is very strictly regulated in state forests that are FSC/PEFC certified and subsequently follow FSC/PEFC pesticide policies. The State Forests enterprise AS LVM defines the permissible amount of chemical to be used in state forests. This amount is calculated based on necessary conditions for forest protection against diseases and other natural calamities and is targeted to the intention to reduce the permissible amount. The use of chemicals in private forests is not very common, however they shall follow the general legislation related to the plant protection products. In state forest enterprise there are responsible personnel, who is involved in the use and storage of chemical and have</p>

	<p>necessary qualification - training on handling of chemicals. The State Forests enterprise AS LVM annually prepares reports on the use and storage of chemicals.</p> <p>State Forest Service periodically controls how forest operations in cutting areas are being or have been implemented according to the existing legal acts. No substantial violations of plant protection product related legislation has been registered by the State Forest Service, so the risk for this indicator is considered low.</p>
<p>Means of Verification</p>	<ul style="list-style-type: none"> <li>• Existing legislation;</li> <li>• Best Management Practice manuals;</li> <li>• Supply contracts;</li> <li>• Records of BP’s field inspections;</li> <li>• Assessment of measures designed to minimize impacts at operational level;</li> <li>• Monitoring records;</li> <li>• Interviews with institutions responsible for overseeing the use of chemicals (State Forest Service, State Environment Inspection, State Plant Protection Service and others).</li> </ul>

	Indicator
<p>2.2.9</p>	<p>The Biomass Producer has implemented appropriate control systems and procedures for verifying that methods of waste disposal minimise negative impacts on forest ecosystems (CPET S5d).</p>
<p>Finding</p>	<p>The Law on Waste Management defines the waste as „various substances and articles belonging to the category of waste, pursuant to the classifier of waste set forth in paragraph 2 of Article 8 of the Law on Waste Management, which are disposed by the holder of waste, which he wishes to dispose or must dispose. The Law provides waste definitions, classification and functions of responsible institutions involved in waste management, monitoring, and storage and other waste management procedures. The State Program on Waste Prevention sets the goals, measures and monitoring procedures for waste reducing and prevention based on the performed analyses. Cabinet of Ministers Regulations No. 485 “On Management of Specific Types of Hazardous Waste” and Cabinet of Ministers Regulations No. 302, “Waste Classification Regulations and Hazardous Waste Properties” provide definition for hazardous wastes and set out procedure and requirements for</p>

	<p>hazardous waste handling, collection and disposal. Oil products according to the aforementioned Regulations are classified as hazardous waste and need to be collected and forwarded to special companies that have necessary license to dispose the wastes in environmentally sound manner. Article 6 of Law on Forests set out requirement to prohibit disposal of wastes in forest.</p> <p>The Forest management plan, the planning documents of individual protected area, the individual regulation of protected objects or selective areas defines the requirements and procedures to prevent the waste disposal in the forests. The waste issue is relevant in the forests nearby cities and recreational objects. It is often practiced that forest management companies have signed agreements with waste management companies for waste collection and transportation from forests and recreational sites. Regional offices of the State Environmental Inspectorate control waste disposal in the forests and takes appropriate measures in case of legal violation.</p> <p>Much of the waste in the forest is disposed by the general public during the summer season, resulting from summer cottages and summer housing, often due to the fact that owners of vacation cottages have not entered into contracts for the collection of household waste. According to the Waste Management Law every household waste producer must have a contract with the waste collection company, covering all costs of waste collection and disposal. Waste collection contracts shall be concluded not only by owners of private houses and apartment tenants, but also cottage, summer home and other temporary accommodation owners or users. This is determined by the Waste Management Law Article 16.</p> <p>According to the information from the State Environmental Inspection, in average 20 complaints about forest areas littering is received annually by the institution, however recent years show reducing trend. There is no information on waste disposed of in private forests. According to the information from the State Forest Enterprise AS LVM about 2000 cubic meters of household waste is collected from state forests annually. The statistics of AS LVM show that despite public awareness campaigns and actions, the amount of discarded waste in the forests remain high. Since 2005, AS LVM is implementing a public awareness campaign "Do not litter the forest!". The purpose of the campaign is to increase the level of public awareness and contribute to cleaner forests in general. During the campaign 200 public forest clean-up actions are taking place all over the country.</p> <p>The Forest owner, irrespective of ownership of municipal, hazardous or industrial waste disposed by third person is obliged to clean up a littered forest area. This is subject to the Waste Management Law Article 15. Forest litter shall be collected and transferred to waste collection company, an operator, which has received the licence for waste management. Costs of waste collection shall be covered by the forest owner or manager, however the forest owner or manager is entitled to claim damages from the waste producer - guilty party. The impact to environment at operational level related to waste in the forests is quite low. Both in state forest enterprise and private forest owners there is prevailing practice to check the felling area and other areas where the forest activities are foreseen before and after work by responsible persons and to ensure that no waste is disposed and that all legal requirements and good practice is followed. In addition, State Forest Service periodically controls how forest operations in felling areas are being or have been implemented according to the existing legal acts, including waste regulations. There is no information on cases of forest wasting at operational level.</p> <p>The risk can be considered as low for this indicator.</p>

	Indicator
2.3.1	<p>Analysis shows that feedstock harvesting does not exceed the long-term production capacity of the forest, avoids significant negative impacts on forest productivity and ensures long-term economic viability. Harvest levels are justified by inventory and growth data</p>
Finding	<p>According to Law on Forest and subsequent Cabinet of Ministers Regulations No. 238 "On National Forest Monitoring", Latvian State Forest Research Institute "Silava" is assigned executing agency for forest resources monitoring at national level. Forest resources are monitored in a 5-year period, using statistical methods. First monitoring cycle had been implemented during 2004.-2008., second monitoring cycle – 2009.-2013. In total monitoring is carried out in 9693 sampling plots distributed evenly all over the country. Each monitoring/sampling plot represents 666ha of forest. During five year period all sampling are visited and monitoring parameters surveyed.</p> <p>During the last decade the annual harvesting rate in Latvian forests was in range of 9.5-13 mil. m<sup>3</sup>. The national forest resources monitoring data shows that as from the second monitoring cycle, the annual increment in growing stock volume is assessed at least 27.3 million m<sup>3</sup>. First cycle monitoring data, based on annual ring measurement show annual growing stock increase in 27.63 million m<sup>3</sup>.</p>

	<p>The amount is in line with sustainable development principle when the harvesting rate does not exceed the annual increment and gives the potential to meet the long-term the economic, social and environmental needs. During the last decade the total growing stock volume in Latvian forests has increased from 546 million m<sup>3</sup> in 2000 to 631 million m<sup>3</sup> in 2010, which means that since 2000 it has increased by 85 mill m<sup>3</sup>. The statistical data about forest use and forest increment is calculated using forest inventory and monitoring data. The statistical information (including growth/drain, inventory, mortality, and age class distribution according ownership type, administrative boundaries and other criteria) is available on-line in the website of the <a href="#">State Forest Service</a>, which is responsible institution for compilation of statistical information on forest resource use, regeneration and vitality.</p> <p>The felling annual rate in state forests is approved by the Government and shall always be lower than those defined in the forest management plan. On an operation level, there is strict control that the allowed felling volume and area set in the cutting technological card shall be followed. Responsible persons from state forest enterprises periodically check the felling area before, during and after activities in order to be sure that the allowed cutting rate is followed.</p> <p>Energy biomass resources in the country are estimated to secure another half of current harvesting volume. Various experts estimates that the biomass resources in the country are estimated to range from 8.4-8.9 million m<sup>3</sup> to 12.6 million m<sup>3</sup>, providing the energy potential from 13-30TWh. Timber harvesting co-products are estimated to be 5.5 million m<sup>3</sup>, harvesting residues 0.5 million m<sup>3</sup>, firewood from harvesting 1.2 million m<sup>3</sup>, firewood in private forests up to 1.7 million m<sup>3</sup>.</p> <p>State Forest Service periodically controls how forest operations in harvesting areas are being or have been implemented according to existing legal acts.</p> <p>The risk can be considered as low for this indicator.</p>
<p>Means of Verification</p>	<p>Harvesting records, inventory and growth data and yield calculations, and Operational Practice indicate that biomass feedstock harvesting rates avoid significant negative impacts on forest productivity and long-term economic viability.</p>

	Indicator
2.3.2	Adequate training is provided for all personnel, including employees and contractors (CPET S6d).
Finding	<p>The analyses made in National Program on Development of Forest Sector concludes that today there is enough number of qualified forest specialists working in forest sector in order to reach the main goals of forest development program. There is a tendency that the number of specialists in the forest sector graduated in universities and highly educated personnel is increasing. However, during the last decade the demand of forest specialists with university or high education degree slightly dropped while the demand in the market for professional specialists like harvest and forward operators has increased. For detailed statistical information about forest employees and their qualification, the tendency during last years it is possible to find in the website of State Forest Service. The educational system in Latvia provides broad scope of education degree, training and scientific knowledge for forest sector. State forest enterprises every year shall analyse the training and qualification demand and prepare the annual training plan for its specialists and workers. The plan shall take into account the employees needs as well as necessary qualification requirements related to their duties and responsibilities. In addition, according to the health and safety legislation, every new employee shall be acquitted with the safety instructions and annually update skills on safety and health requirements attending special courses or instructions. This must be proved by corresponding documents and training records. Many forest cuttings and other forest activities in state and private forests are performed by contractors, which have the obligation to have necessary qualification and corresponding documents. When state forest enterprises organize the tender they ask contractors for the documents, which could prove their qualification as well as other skills needed for the job. The Order on forest work safety requires that every forest worker shall have the necessary qualification and corresponding documents. The state forest enterprises and contractors are periodically controlled by the State Labour Inspection, State Forest Service, authorities of fire protection and other controlling institutions to check that all workers have the necessary qualifications skills, corresponding documents and other necessary skills.</p> <p>It is prevailing practice to include in the agreement with contractors the requirements to have the necessary qualification.</p> <p>The risk can be considered as low for this indicator.</p>

	Indicator
2.3.3	Analysis shows that feedstock harvesting and biomass production positively contribute to the local economy including employment.
Finding	<p>The Forest Policy of Latvia (1998) and its Implementation Strategy – Forest-based Sector Development Guidelines (2006) define that forests is one of the main Latvian natural resources having principal economic, social and ecological value. Forest is renewable and increasing forest resource, occupying half of the country's territory and has substantial economic ecological and social functions of the forest sector economy.</p> <p>Forest sector (including forest industry) constitute 7-8%, out of which in forestry sector – about 6% of Gross Domestic Product (GDP). Forestry sector creates 20% of total added value of industry in the Republic of Latvia. Forestry sector employs 5% of country labour force. The Forestry sector exports 70-80% of products. State forest enterprise AS LVM in the form of various taxes and royalties pay to the state budget annually about 70 mill. Euro.</p> <p>Firewood accounts for stable ground in the energy consumption. The share of thermal power generation has been steadily increasing and accounts for more than 30% of the primary heating energy balance. This is driven mainly by household consumption and increasing biomass use in public heating in municipalities. In the last years a number of biomass powered boiler houses have been installed in cities, which has contributed to increasing demand for chips and pellets. Industry, mainly in the forestry enterprises, consumes about 25% wood processing products (bark, sawdust, wood chips and remnants), to ensure the technological process and the necessary heat.</p> <p>There are currently around 1,450 municipal boiler houses operating in the country using wood-energy - firewood or wood-chips. Largest wood powered boiler house capacity is about 10 MW. Firewood accounts to 60% of energy-wood consumption. During the last 5 years the share of pellets has increased from 3-5% to 8-10%, while the share of wood scrap has reduced. Demand for wood chips has stayed at the same level.</p> <p>The total growing stock volume amounts to 631 mil. m<sup>3</sup>. Forest resources during the last 50 years have steadily increased and at this time can sustainably meet the public needs, which are reflected in aforementioned strategic document. The National Program Forest-based Sector Development Guidelines provides similar indicators related to forest sector contribution to local economy, namely: forest sector's contribution to the national economy comprises 5-8% annually, out of which in forestry sector – six per cent of GDP. The number of employees working in the forest sector during last 10 years has been steadily increasing.</p> <p>Based on statistical data on forest sector contribution to the local economy during the last 10 years and the forecast for the coming 10 years it is obvious that the forestry sector remains one of the contributors to the local economy. Statistical data on forests as well as the economic and commercial indicators and perspective plans of forest sectors are available in the website of the <a href="#">Ministry of Agriculture</a> and the <a href="#">State Forest Service</a>.</p> <p>The National Program on Development of Forest Sector sets the objective to increase biomass driven power and energy generating capacity. Taking into account goals set in the National Program on Development of Forest Sector as well as current trends in in biomass production and use, a positive influence of biomass production and its contribution to the local economy can be expected.</p>
Means of Verification	Analysis of contribution. Sectoral analysis reports from the Ministry of Agriculture, forest industry associations

Risk Rating	<input checked="" type="checkbox"/> <b>Low Risk</b> <input type="checkbox"/> <b>Specified Risk</b> <input type="checkbox"/> <b>Unspecified Risk at RA</b>

	Indicator
2.4.1	The Biomass Producer has implemented appropriate control systems and procedures for verifying that the health, vitality and other services provided by forest ecosystems are maintained or improved (CPET S7a).
Finding	<p>One of the principal goals of Latvian Forest Policy and Implementation Strategy is the protection of biodiversity and maintenance of the forest vitality. It is acknowledged that forests are crucial to the overall conservation of biodiversity on land, while forest biodiversity lies in its productivity, regeneration and viability and sustainable forest management. Measures to achieve this goal are: reforestation and afforestation based on ecological and genetically sound base, planting more mixed forests and especially the hardwood species, combining natural and artificial reforestation, protection of coastal and river forests, increase of assortment in forest nurseries, selection of valuable forest populations in every forest natural region, protecting their natural and genetic composition and rationally using genetic resources for reproduction, reducing the use of chemical agents and replacing them by mechanical and biological means, etc.</p> <p>State Forest Service is responsible authority for forest health condition monitoring in all forests in Latvia and survey for forest health and issues opinion on forest health condition. The State Forest Service carry out a forest health condition monitoring in all Latvian forests to ensure forest management in a way that does not deteriorate the state of forest health and timely detection of pest proliferation and outbreaks.</p> <p>In 2013 Harvesting Permits for sanitary felling were issued for 1393.1 ha of forest or 0.05% of the total forest area in the territory of Latvia, including 555.4 ha (40%) - in state forests and 837.8 ha (60%) - other users of forests. Compared to previous years the area of sanitary felling cuts has increased, but the level is corresponding to the average annual level if looking at the long-term statistics.</p> <p>The most important factor in forest damage in Latvia is windfall, which accounts for about half of damage volume. Quite a lot is also excessive moisture resulting in fatalities of forest stands. Other causes: pests, diseases, animals, fires is less significant. The largest proportion of damaged forest stands according to SFS data is found in Latgale - 415.41 ha (0.08%), Zemgale - 253.7 ha (0.06%) and Vidzeme - 409.2 ha (0.05%), least in Kurzeme - 219.7 ha (0.03%) and Riga/Riga region - 95 ha (0.02%). Larger scale of wind damage is observed in Latgale and Vidzeme regions. In all regions, a relatively large proportion of forest damage is caused by excessive humidity, caused mostly by beaver activity.</p> <p>The largest pest outbreaks are associated to the spruce bark beetle (<i>Ips typographus</i>). In 2013, the spruce bark beetle caused forest damage in an area of 96.6 ha, but its population is at a low level and an increase has not been established. Only a few cases of coniferous pests (sawfly) outbreaks was identified. In Daugavpils city forests about 200 hectares of pine stands was damaged by a sawfly (<i>Acantholyda posticalis</i>) outbreak, causing significant defoliation of pine stands. Pest hazards are associated with the proliferation durability as it can take up to 10 years. Since 2012, an increase in the pine sawflies (<i>Neodiprion sertifer</i>) population was observed. While mass proliferation has not been observed, pest colonies are present in the relatively wide areas of Kurzeme, Vidzeme and Zemgale regions, so careful</p>

	<p>monitoring of this pest population is foreseen in the coming years according to the report of the State Forest Service.</p> <p>The risk can be considered as low for this indicator.</p>
Means of Verification	<ul style="list-style-type: none"> <li>• Overall evaluation of potential impacts of operations on forest ecosystem health and vitality based on data from overseeing institutions;</li> <li>• Assessment of potential impacts at operational level and of measures to minimise impacts</li> <li>• Best Management Practice manuals</li> <li>• Supply contracts;</li> <li>• Monitoring results;</li> </ul>

	Indicator
<b>2.4.2</b>	The Biomass Producer has implemented appropriate control systems and procedures for verifying that natural processes, such as fires, pests and diseases are managed appropriately (CPET S7b).
Finding	<p>The Regulations on forest protection against fires defines the general requirements for establishing anti-fire measures, for instance, mineralized lines in forests as well as sets the procedures for organization of fire extinguishing system in state and private forests. The State program on forest fire protection establishes and ensures the protection of all forests (state and private) against forest fires. Latvian forests according to the burning class are divided into 3 categories (low, medium and high). Forest management of state and private forests are based on the forest management plans where the procedures and measures to verify that natural processes, fires, pests and diseases are managed appropriately are defined. Forest management plan as the main planning document includes the Forest fire management plan, which comprises of Fire protection line plan, Operational fire extinguishing plan and maps of forest fire management. In Latvia the fire prevention and monitoring system covers all Latvian forests. There is the watch-tower network covering the territory of Latvia involving watchmen who detect and identify forest fires in fire season and warn the responsible institutions. In addition, state forest enterprise has on ground monitoring system and responsible persons for monitoring and reporting about forest fires. The integrated warning system allows to report about forest fire using the integrated phone</p>

	<p>number. The statistical information about forest fires is available on the website of State Forest Service. State forest enterprise personnel monitor forests on a daily basis, especially during the fire season, and visit the operational sites in order to ensure that natural processes, fires, pests and diseases are managed appropriately. Forestry worker and personnel are instructed about fire prevention and protection measures and get the appropriate training. In addition, State Forest Service periodically controls forest operations in forest felling areas for compliance with existing legal acts related to fire safety.</p> <p>According to information from the State Forest Service, almost all forest fires are discovered within half an hour from the break-out, and fire station car with forest fire brigade is sent to the place of forest fire. Up to 80% of all forest fires are discovered and operatively disposed so that the area damaged by fire does not exceed 0.5 ha. In extensive forest fire fighting special heavy machinery - bulldozers, excavators are used for fire suppression and elimination. In order to ensure involvement of machinery in coordinated emergency procedures in these situations cooperation agreements are being concluded with various organizations and fire emergency plans have been drawn up to specify obligations of involved parties and participation procedures for fires.</p> <p>The Regulations on Tree Felling in Forest defines the procedures, responsible institutions and measures for forest protection against pests, diseases and other natural calamities. The monitoring data on forest sanitation conditions and damages are available at State Forest Service. Statistical data about forest sanitation conditions, measure for forest sanitation protection, list of related legal acts, diseases and pests as well as various scientific reports are available on the website of <a href="#">State Forest Service</a>.</p> <p>State Forest Service is responsible authority for forest health condition monitoring in all forests in Latvia and survey for forest health and issues opinion on forest health condition. The State Forest Service carry out a forest health condition monitoring in all Latvian forests to ensure forest management in a way that does not deteriorate the state of forest health and timely detection of pest proliferation and outbreaks.</p> <p>In 2013 Harvesting Permits for sanitary felling were issued for 1393.1 ha of forest or 0.05% of the total forest area in the territory of Latvia, including 555.4 ha (40%) - in state forests and 837.8 ha (60%) - other users of forests.</p> <p>The most important factor in forest damage in Latvia is windfall, which accounts for about half of damage volume. 	Indicator
2.4.3	The Biomass Producer has implemented appropriate control systems and procedures for verifying that there is adequate protection of the forest from unauthorised activities, such as illegal logging, mining and encroachment (CPETS7c).
Finding	<p>State Forest Service periodically controls how forest operations in cutting areas are being or have been implemented according to the existing legal acts. The State Forest Service has an annual control plan. Even though legal authorities have increased control of illegal logging in Latvia, some illegal logging still occurs.</p> <p>Prior to performing logging activities, every forest owner must obtain a harvesting permit. The institution responsible for issuing harvesting permits is the State Forest Service. A harvesting permit is issued by a professional forestry official (a forester) in accordance with the requirements of the relevant forest legislation. The principal requirement for obtaining a harvesting permit is that the forest owner has a valid Forest Management Plan, including full forest inventory. Prior to issuing a harvesting permit, the State Forest Service specialists randomly check whether the situation in relation to the forest property conforms to the legislation requirements. A felling permit is not issued in 1% of cases of application.</p> <p>A harvesting permit is not required for certain types of felling works, i.e. pre-commercial thinning, cutting of dead and windfall trees, maintenance of forest clearings etc.</p> <p>There has been a significant effort to implement tighter controls over illegal logging in Latvia. The number of cases of illegally harvested wood was reduced from 2000–3000 per year in the period 2000 to 2005, to around 400 cases in the years following 2005, with some illegal logging still occurring. The number of illegal logging cases has been stable over the past four years (2010–2013), ranging from 322–348 cases per year, with an extreme of 485 cases in 2010. In 2013, 348 cases of illegal logging were detected in both State and private forests, corresponding to 20,300 m<sup>3</sup> of illegally logged wood. The volume of illegally harvested wood ranges from 16.5 thousand to 20 thousand m<sup>3</sup> per year. The major share of illegally felled wood (77%) was linked to private forests. Judicial statistics for the year 2013 provide the details of the persons who have been convicted by the Criminal Law Article 109 "Illegal felling and damaging of trees". According to the statistics, 50 people were convicted of illegal tree felling and damage in year 2013.</p> <p>According to statistical data provided by the State Forest Service, the share of known illegally logged wood in Latvia ranges from 0.13%–0.17% of the total felled timber volume over the</p>

	<p>last 4 years (2010-2013). The ratio has been relatively stable, although the latest available data for the year 2013 shows a slight increase in volume of illegally logged wood.</p> <p>There is a risk of corruption of forestry officials. The risk is substantially minimized through the implementation of internal control over the issued harvesting permits and control of forestry works within the State Forest Service. Over the last three years there have been no official cases of bribery reported among persons responsible for issuing harvesting licenses. However, Transparency International – in their National Integrity System Assessment – reports that in Latvia, "donations by state-owned companies are a particularly vulnerable form of public support".</p> <p>Considering the current score on the Corruption Perception Index (CPI=55, year 2015) and no known cases of corruption in the State Forest Service, the risk is considered low.</p>
Means of Verification	<ul style="list-style-type: none"> <li>• Overall evaluation of data from overseeing institutions;</li> <li>• Assessment of potential impacts at operational level and of measures to minimise impacts</li> <li>• Regional Best Management Practice manuals;</li> <li>• Supply contracts;</li> <li>• Monitoring results;</li> </ul>

	Indicator
2.5.1	The Biomass Producer has implemented appropriate control systems and procedures for verifying that legal, customary and traditional tenure and use rights of indigenous people and local communities related to the forest are identified, documented and respected (CPET S9).
Finding	There are no indigenous people in the country since Latvians are native in their homeland. However, there are national minorities (traditional communities) in Latvia – such as Russians, Jews, Belarusians and other nationalities. Brief evaluation of various reports were done in order to confirm low risk for protection traditional people’s rights. All reports states that Latvia has sufficient legislation for traditional rights protection. Education, medical care, employment and other social programs have been implemented. There are no recognized acts on violations of rights, customs and culture and there is no evidence of violations of traditional and/or customary rights, including use rights, cultural interest or

	<p>traditional cultural identity. In Latvia, representatives from national minorities (traditional communities) and Latvians have the same land use rules and rights. Latvia has not ratified ILO convention 169. Main laws and regulations that govern identification of national minorities (traditional communities) are: Constitution of the Republic of Latvia; Convention for protection National Minorities which was ratified by the Government in 2005. Customary rights to non-timber forest products in state conservation areas are defined by special regulations allowing local communities to collect berries and mushrooms as well as fishing activities, assuming they follow special provisions.</p> <p>The risk can be considered as low for this indicator.</p>
Means of Verification	<ul style="list-style-type: none"> <li>- Customary and traditional tenure and use rights are identified and documented;</li> <li>- Interviews with local communities and other stakeholders, indicate that their rights are respected;</li> <li>- Appropriate mechanisms to resolve disputes exist;</li> <li>- Agreements exist regarding customary rights.</li> </ul>

	Indicator
2.5.2	The Biomass Producer has implemented appropriate control systems and procedures for verifying that production of feedstock does not endanger food, water supply or subsistence means of communities, where the use of this specific feedstock or water is essential for the fulfilment of basic needs.
Finding	Main necessities of local communities are related to recreation and mushroom and berries picking. These activities are important for many people for leisure or perquisite income. The right to free access to state and municipal forests are guaranteed in the Constitution of Republic of Latvia, Forests Law and other legal acts. With few exceptions all forests are available for berries and mushroom picking. Exceptions include only the strict nature reserves, where access for the general public is restricted. Forest management does not play a significant role in relation to community necessities with regard to forest non-timber resources, as forests in Latvia cover about 50% of the territory and various succession stage forests are present in the landscape. Therefore, no risk related to this indicator exist. It is general practice that state forest enterprise AS LVM allow the local inhabitants to collect logging residues from cutting areas, upon notification. In addition, local people can buy fuel wood without any restrictions. The market analyses indicate that there is not lack of fuel wood for local people and that forest operation does not cause and influence the lack of basic needs for local people.
Means of Verification	Interviews with local communities and other stakeholders indicate that subsistence needs are not endangered. Agreements exists on resource rights where these impact on the needs of communities

	Indicator
<b>2.6.1</b>	The Biomass Producer has implemented appropriate control systems and procedures for verifying that appropriate mechanisms are in place for resolving grievances and disputes, including those relating to tenure and use rights, to forest management practices and to work conditions.
Finding	<p>Grievances and disputes, including those relating to tenure and use rights, to forest management practices and to work conditions are regulated by general, horizontal legislation: The Constitution of Latvia (Satversme), Latvian Civil Code, Labour Law, Code of Administrative Violations etc. The detailed procedures, duties and responsibilities of involved persons are defined in the general legislation. The land restitution process in Latvia has not been completed, therefore most cases of grievances and disputes are related to the establishment of tenure and use rights over forests under restitution process and disputes over borders of properties. There is procedures, which shall be followed during restitution process when the independent land measurement organization is hired to define and set the border of private forest owner and user. During the measurement process, the owner of forest land participates and signs the report of measurement. In the report, the owner can write his disagreements, comments or simply not sign the report at all. In such cases, the dispute is solved together with independent measurement organization. If no solution is reached, there is the possibility to apply to higher controlling institution (the State Land Service) or seek for solution via court case.</p> <p>It is the prevailing practice to include additional clarification statements in the working agreements concerning the dispute resolutions. In addition, the trade unions can assist in solving disputes over working conditions and can use their own procedures and agreements.</p> <p>The risk can be considered as low for this indicator.</p>

	Indicator
2.7.1	The Biomass Producer has implemented appropriate control systems and procedures for verifying that Freedom of Association and the effective recognition of the right to collective bargaining are respected.
Finding	<p>According to the Law on Trade Unions, Trade Unions have the right to supervise the employer's adherence to and implementation of the labour, economic, and social laws related to the rights and interests of their members, as well as of the collective and other agreements. Article no 18 states - The Right of Trade Unions to Demand the Annulment of the Employer's Decisions which violate labour, economic, and social rights of their members provided by the laws of the Republic of Latvia. Law gives The Right of Trade Unions to Propose that Legal Action be Taken against Officials who violate laws on labour, or who do not ensure safety at work, or who do not execute the collective or other mutual agreements. Latest the Trade Union Confederation report shows positive trends in the Latvian labour sector. There were no major law violations identified in order to uphold the right of freedom of association and collective bargaining. In most of the state enterprises trade unions are established, handling the agreement with the employee and periodically reviewing this agreement, for which the work conditions and other related issues are discussed and defined. Latvia has signed and ratified the ILO Declaration on Fundamental Principles and Rights at Work including the ILO Conventions 98, 87 and 135, which came into force 26 September 1994.</p> <p>The risk can be considered as low for this indicator.</p>

	Indicator
2.7.2	The Biomass Producer has implemented appropriate control systems and procedures for verifying that feedstock is not supplied using any form of compulsory labour.
Finding	<p>According to the Latvian Constitution (Satversme, 1993) Article Nr. 106 forced labour is prohibited, though Forced labour is not considered the involvement of disasters and their effects and work pursuant to a court order. Latvia ratified relevant ILO Conventions concerning Forced or Compulsory Labour C029, which came into force in 2006 and Abolition of Forced Labour Convention (C105), which came into force into 1992. Ministry of Welfare is responsible institutions for implementing conventions and taking measures to avoid forced or compulsory labour in the country.</p> <p>According to the Global Slavery Index (GSI) Latvia in 2014 ranks <a href="#">140</a> (least is worst) out of 167 evaluated countries in the World and <a href="#">19th</a> out of 37 in Europe. According to the GSI study “the government has introduced a response to modern slavery, which includes short term victim support services, a criminal justice framework that criminalizes some forms of modern slavery, a body to coordinate the response, and protections for those vulnerable to modern slavery. There may be evidence that some government policies and practices may criminalize and/or cause victims to be deported, and/or facilitate slavery”. The following GSI indicators have been evaluated: Attitudes, social systems and institutions that enable modern slavery are addressed – 50%, Coordination and accountability mechanisms for the central government are in place – 58%, Criminal justice mechanisms address modern slavery -81%, Survivors are identified, supported to exit, and remain out of modern slavery - 61%. Problematic area according to the study is Business and Government – businesses and government through their public procurement stop sourcing goods and services that use modern slavery. This category has received 0% score.</p> <p>The State Labour Inspections annual reports does not point out issues with forced labour.</p>

	Indicator
2.7.3	The Biomass Producer has implemented appropriate control systems and procedures to verify that feedstock is not supplied using child labour.
Finding	<p>The Republic of Latvia has been a member state of the ILO since 1991. The country has ratified 40 ILO technical Conventions, including the eight fundamental Conventions and 4 Priority Governance Conventions. Latvian legislation covers all aspects of equal rights. In 1995 06 20 Latvia has ratified the Convention for the Protection on Human Rights and Fundamental Freedom (1950) no 005. The Republic of Latvija has also ratified the fundamental ILO convention related to the child labour, i.e. C182 - Worst Forms of Child Labour Convention, 1999 (No. 182).</p> <p>The Labour Law prohibits employing children on a continuous basis. In exceptional cases, children from the age of 13 years may be employed after school hours in light work that does not impede the child's safety and health, if one of the parents has given their written consent. Such an employment shall not impede the child's schooling. The kind of work that may employ children at the age of 13 years is determined by the Cabinet of Ministers Regulations. Cabinet of Ministers Regulations No. 206 "Regulations on work which prohibits the employment of adolescents and exceptions when employment in such jobs is permitted for adolescent vocational training", lists jobs prohibiting the employment of adolescents and exceptions when employment in such jobs is permitted for adolescent vocational training. The Labour Law establishes a framework for persons under the age of 18 years, in terms of their working time, rest periods and wages.</p> <p>The State Labour Inspection controls the implementation of employment legislation, including employment of children or adolescents under the age of 18. No information on illegal employment of children or adolescents under the age of 18 is described in the annual reports of the State Labour Inspection.</p> <p>Existing information about child labour in the reports of acting institutions were reviewed. Report of the Ministry of Welfare states that the State Labour Inspectorate prepares methods and recommendations concerning illegal work practices, organizes seminars, establishes the procedure of cooperation between officials of supervisory authorities and institutions in organizing joint checks, analyses results of control and furnishes conclusions to all authorities and institutions exercising control over illegal work, organizes educational activities aimed at the development of intolerance toward illegal work practices and encouraging the public to participate in identifying such practices and implements other measures.</p> <p>Report "An overview of the situation of children in Latvian In 2012" reports cases of child employment without an employment contract. During the period of 2010-2012 a few cases of adolescent employment without a written contract has been identified in the forestry and</p>

	<p>wood processing industries: 1 case in 2010, 3 cases in forestry, 4 in wood processing industry in 2011, 3 cases in forestry and 6 cases in wood processing industry. During the 3-year survey period (2010-2012) 2 cases of illegal employment, i.e. employment without a permit from the State Labour Inspection were identified. In addition, 1 case of adolescent employment in a work area that is prohibited to adolescents was identified.</p> <p>Given the provisions of legal framework, responsible institution regular checks for compliance and the low number of cases of violation of legislation, the risk for this indicator is considered low.</p>
<p>Means of Verification</p>	<p>Existing legislation;</p> <ul style="list-style-type: none"> <li>• Level of enforcement;</li> <li>• Supply contracts;</li> <li>• Records of BP’s field inspections;</li> <li>• Assessment at an operational level of measures designed to minimise impacts on the values identified;</li> <li>• Monitoring records;</li> <li>• Interviews with staff, stakeholders.</li> </ul>

	Indicator
2.7.4	The Biomass Producer has implemented appropriate control systems and procedures for verifying that feedstock is not supplied using labour which is discriminated against in respect of employment and occupation.
Finding	<p>According to the Constitution of the Republic of Latvia (Satversme) (1993) Article no 106 forced labour is prohibited. Latvia has also ratified ILO Convention concerning Forced or Compulsory Labour No C029, which came into force on June 2, 1996. The Ministry of Welfare is responsible for implementing this convention and taking all measures to avoid forced or compulsory labour in the country. Exploring the situation of compulsory and/or forced labour in Latvia nongovernmental researches have been analysed but no major evidences were identified regarding compulsory and/or forced labour in the country. Even though analysed reports of independent sources such as Special Euro barometer 393; European Commission and The Ministry of Welfare show that recommendations for improvement are given to Latvian acting authorities - there are no major discrimination evidence in the country in respect of employment, and/or occupation, and/or gender. The Office of Ombudsperson is an independent state institution appointed by and accountable to the Parliament. The Ombudsman investigates individual complaints on the grounds of gender, age, racial or ethnic origin, religion beliefs, disability, sexual orientation, language, social status; submits recommendations and proposals to the Parliament, governmental institutions on the priorities of gender equality policy, including recommendations on amendments to relevant legislation. Latvian legislation covers all aspects of equal opportunities. A person may not have his rights restricted in any way or be granted any privileges on the basis of his or her sex, race, nationality, language, origin, social status, religion, convictions or opinions.</p> <p>Latvia has been a member state of the ILO since 1991. The country has ratified <a href="#">52 ILO International Labour Standards (Conventions)</a>, including the eight fundamental Conventions, 4 Governance Conventions and 40 Technical conventions. Latvian legislation covers all aspects of equal rights. Latvia has ratified the Convention for the Protection on Human Rights and Fundamental Freedom (1950) no 105. Ministry of Welfare is responsible for implementing this convention and taking all measures to assure equal rights in any groups related to the above. In order to find evidence, that any groups (including women) do not feel adequately protected in terms of rights and evidence of discrimination against women and/or gender inequity, reports of independent parties were reviewed. The report evaluation showed positive trends. Mechanism for implementation of the Program for the Advancement of Woman has been created and continuously developed, supporting women’s issues on all levels. A number of women in the governmental sector has increased. There has been an increase in the number of woman’s organizations. The attitude of the authorities and understanding of gender related and equality matters is gradually changing in the society. All analyses above were done mostly focusing on the forestry sector. There were no evidences found about violations limited to the specific sectors.</p> <p>The risk can be considered as low for this indicator.</p>

	Indicator
2.7.5	The Biomass Producer has implemented appropriate control systems and procedures for verifying that feedstock is supplied using labour where the pay and employment conditions are fair and meet, or exceed, minimum requirements.
Finding	<p>Legal employment in Latvia is defined by number of different legislation. According to legislation all employees shall have signed employment contract which is a basis for obligatory social security, ensured by paying social security tax. According to the requirements of the Labour Law, the employment contract must be in writing and it must contain essential provisions in order to be valid, such as conditions of payment, the place of work and a job description. Certain types of employment contracts may require additional provisions such as the term of the contract, seasonal work etc. Temporary hires, provided through employment agencies, offer an alternative to fixed term contracts. Temporary employment is relevant in the country as a flexible solution for part time, seasonal works, project or fixed term employment and as a risk management strategy at the start up stage. The Labour Law sets an obligation for the employer and employee to enter into a written contract of employment prior to commencement of work. With a contract of employment, the employee undertakes to perform specific work, subject to specified working procedures and orders of the employer, while the employer undertakes to pay the agreed work remuneration and to ensure fair and safe working conditions that are not harmful to health. Signed employment contract is a basis for obligatory social security payments. In addition to signed contracts, employees working in forestry sector companies are obliged to have an Employee License/Card (Nodarbinātā apliecība) issued by the contractor. The Employee license/card must be present at site/plot in the forest.</p> <p>Official statistics from the State Labour Inspectorate does not provide information on cases of illegal employment in forestry sector. The statistics is provided for agriculture, forestry and fisheries sectors combined. According to information from the State Labour Inspectorate, cases of illegal employment has risen from 199 cases in 2011 to 236 in 2013 (207 cases in 2012) (<a href="http://www.vdi.gov.lv/files/parskats_2013.pdf">http://www.vdi.gov.lv/files/parskats_2013.pdf</a>). Agriculture, forestry and fisheries sector ranks the 4th biggest in terms of identified cases of illegal employment after the construction industry, trade and sales and processing industries. No information on cases of illegal employment is provided for the forestry sector alone. However, agriculture and fisheries sector are often mentioned as risk sectors related to illegal employment. The State Labour Inspectorate reports that overall illegal employment cases in year 2013 were twice as many as in 2009.</p> <p>A recent report on work conditions and risks related to occupational health reveals that among the respondents working for one employer, most frequently employees without a written contract occur in agriculture and forestry sector (11.0%) in year 2013, 7.9% in 2010.</p>

	<p>Depending on the sector represented by the respondents in 2013 written contracts of employment were found less important by the employees of agriculture, forestry (82.9%) sectors. (Work conditions and risks in Latvia, 2012-2013).</p> <p>Unofficial information from forestry and wood processing companies indicate that issues of legal employment is related to the size of the company and region where the company is operating. Small and new companies tend to have higher risk in terms of illegal employment and tax avoiding. According to the outcomes of the study (Shadow Economy Index in Baltic States 2009-2013) there are not many employers that employ workers without a contract thus contributing to unregistered employment. In turn, there is a significant share of employers who enter into contracts with workers on the minimum wage or slightly larger amount, but the largest part of remuneration paid in cash avoiding taxes (envelope wage). There is no available information on cases where non-EU foreign workers working in the forest or wood processing sector without a residence permit and subsequently without a contract and social security insurance.</p> <p>Based on the information provided above it is seen that even though there might be some cases of illegal employment in the forestry sector, the control and preventive measures implemented by legal authorities as well as positive trends towards reduced illegal employment rates in the forestry sector provide solid background for defining this sub-category as low risk.</p>

Risk Rating	<input checked="" type="checkbox"/> <b>Low Risk</b> <input type="checkbox"/> <b>Specified Risk</b> <input type="checkbox"/> <b>Unspecified Risk at RA</b>

	Indicator
<b>2.8.1</b>	The Biomass Producer has implemented appropriate control systems and procedures for verifying that appropriate safeguards are put in place to protect the health and safety of forest workers (CPET S12).
Finding	<p>The Labour Protection Law provides the legal framework for the occupational health and safety system in Latvia. This includes the rights and obligations of an employer and an employee in creating and ensuring a working environment, which is safe for occupational health. The Law also establishes principles of occupational health and safety system in organizations, sets the procedure for challenge proceedings, and the liability for violation of the occupational health and safety requirements. Implementation of Occupational Health and safety legislation is monitored and controlled by the State Labour Inspectorate. The State Labour Inspectorate collects data on work related accidents and regularly monitors and reports occupational health and safety compliance statistics for companies in different sectors of economy.</p> <p>According to State Labour Inspectorate data, wood processing industry ranks top 3 industries with accidents at the workplace. Other top industries with regard to injuries at work are transport and construction businesses. During the last 5 years, the total number of accidents at workplace has been in the range of 140-160 accidents per year, including 20-22 heavy injuries and 2 cases with lethal outcome. Wood harvesting and silviculture industry with 20-25 accidents per year ranks 20 in the top 20. According to statistical data, timber harvesting and silviculture sector accounts for 6-7 major injuries per year. In 2012 there were 4 lethal injuries, however in 2013 there was none. In absolute terms wood processing industry accounts for 9-10% of all registered injuries at work place and timber harvesting and silviculture sector - 1-2%.</p>

The State Labour Inspectorate reports that main issues related to the implementation of the occupational health and safety legislation in the forestry and wood processing sector companies are: companies lack trained occupational health and safety specialists (39% of verified companies); companies do not undertake physical and chemical measurements of risk factors (49% cases); work equipment is not safely used and maintained; employees do not use provided personal protective equipment (PPE), suggesting lack of supervision by employer; and employees do not take the compulsory medical examination (40% cases). Most of the administrative fines applied to companies operating in forestry and wood processing sector are related to avoiding compulsory health examinations; failure to document regular equipment maintenance; failure to equip moving parts of work equipment with safety devices; failure to prepare an occupational health and safety action plan; failure to inform employees about risk factors and risk assessment at workplace.

The overall rate of serious injuries per 100,000 workers in 2013 in Latvia has increased in the last 5 years by 46%, totalling to 201 cases in 2013. Similarly, the rate of heavy injuries has increased 38% in last 5 years. The rate of death cases has been fluctuating in range from 3-3.67 cases per 100 000 persons employed in last 5 years. The average incident rate (number of accidents in relation to the 100 000 persons employed) in 27 European Union countries in 2011 was 1.94. According to Eurostat data, Latvia ranked 25th in 27 EU states with regard to number of fatal accidents at work (incident rate per 100 000 persons employed) in 2011. It has to be noted that the rate of heavy injuries and death cases has decreased slightly in 2013 compared to 2012.

A recent report on work conditions and occupational health issues (Work Conditions and Risks in Latvia, 2012-2013) surveyed health disorders that have been caused by the occupational hazardous factors (for example, noise, vibration, dust, chemical substances etc.) in opinion of workers. Comparing with the survey of 2010 in 2013 number of the respondents considering they have health disorders caused by occupational hazardous factors has grown by 2%, whereas number of the respondents considering they do not have any kind of such disorders has decreased by 6% thus equalling with the level of 2006. Most frequently, health disorders were mentioned by employees from the sector of manufacture of textile and clothing products in the survey of 2013, the agriculture and forestry sector being mentioned as third highest (27.9%). In the survey of 2013 the highest rates of the respondents indicating that they have not received information on hazardous factors of their workplaces are among companies dealing with manufacture of wood, products of wood and cork and of furniture (in 2013 – 25.3%, in 2010 – 21.6%), agriculture and forestry (in 2013 – 20.6%, in 2010 – 22.3%).

According to the report (Work Conditions and Risks in Latvia, 2012-2013), legal requirements regarding labour relations and legal labour relations are not followed more frequently in companies operating in fisheries, agriculture and forestry sector (considered risk groups) as well as in companies located in Riga and Zemgale regions and private sector companies in general.

Commercial entities operating in forestry sector, working in certified PEFC/FSC FM/COC certified forest operations as a subcontractors are monitored both by the forest managers, and accredited FSC certification bodies. Logging companies providing logging services for FSC certified operations are considered being at low risk in relation to occupational health and safety requirements due to periodic verification by both the contracting company and 3rd parties – certification institutions.

Given the aforementioned arguments, “specified risk” is proposed for this indicators targeting companies working in non-certified.

The arguments for the above mentioned risk evaluation were discussed during the stakeholder consultation process. Stakeholders support specifying “low risk” to this

indicator. Arguments for “low risk” include the fact of increasing mechanization of harvesting works, i.e. majority of harvesting works are carried out with forestry machinery. In particular, up to 80% of harvesting works are carried out with mechanical means. Secondly, it is pointed out that there is regulatory framework in place and strong enforcing mechanisms established with regular inspection and controls at workplace. The statistical data has been provided by the industry showing decreasing trend in lethal accidents in forestry sector since 2010 and no lethal accidents at workplace in 2013. Thirdly, rapidly developing trade and professional education is mentioned as a contributing factor to reducing of number of accidents at workplace in the forestry sector.

There have been objections to using the health and safety statistics data by Eurostat (number of accidents at workplace per 100k inhabitants) showing rather poor situation in the country in comparison with other EU countries. In the view stakeholders, general Eurostat data alone cannot be used for characterization of situation with health and safety issues in the forestry sector and extrapolating general, national data to particular sector. In the case of forestry sector, a more appropriate comparison in the opinion of stakeholders would be comparison of a number of cases of accidents per number of workers in the industry or volume of harvested timber.

Issues were discussed in line with relevant information regarding work conditions and occupational health issues from an NGO perspective compiled in the report (Work Conditions and Risks in Latvia, 2012-2013, Employers' Confederation of Latvia, “TNS Latvia Ltd.” and Institute for Occupational Safety and Environmental Health of Rīga Stradiņš University). Common health and safety issues outlined in the report are underreporting of accidents, forestry and agriculture being among sectors of highest number of health disorders caused by occupational factors, forestry and agriculture sectors mentioned among sectors with highest risk of not following labour legislation. Stakeholders did not agree to the information provided in the report due to lack of data on forestry sector specifically.

In response to the stakeholder comments additional consultancy was carried out in order to seek for forestry sector specific data and opinion on occupational health and safety issues. The Latvian Confederation of Employers and the Institute for Occupational Health and Safety at Rīga Stradiņš University have been contacted to obtain data on forestry sector. The thematic report on forestry sector was provided and used as a main source of additional information.

The thematic report addresses occupational health and safety issues in the forestry sector. The forestry sector is considered economy sector 02 Forestry and harvesting according to NACE v.2 classification and includes following subsectors: 02.1 Silviculture and other forestry activities; 02.2 Harvesting; 02.3 Collection of forest products; 02.4 Supporting activities in forestry. The report is based on both forest sector employer and employee survey and available data. 52 commercial entities have been surveyed as a part of the survey. The report provides analysis of distribution and trends of occupational health risk factors, including: capacity of companies and external services used with regard to occupational health and safety; OH&S risks in the view of employers and employees; investments in OH&S in the view of employers and employees; risk minimisation measures; results of measurements of occupational environment in commercial entities; analysis of accidents at workplace and analysis of occupational diseases

The following issues analysed in the report are considered relevant in relation to the risk assessment.

The total registered number of accidents per 100 000 employed in forestry sector in last decade has decreased significantly. In particular, the number of accidents has fallen sharply in 2008 and 2009 - from 519.2 cases per 100 000 employed in 2007 to 126.0 cases per 100

000 employees in 2009. In 2010 growth was experienced and reached 254.5 registered cases per 100 000 employees in 2012. Since then a downward trend is exhibited.

A similar situation is observed in relation to heavy accidents. The bottom of registered number of cases was observed in 2009 - 14.0 cases per 100 000 employees, but already in 2010 a sharp increase was observed. In 2012 63.6 serious accidents per 100 000 employees were recorded. This however is relatively low compared to the number of accidents in 2007. According to the report number of heavy accidents in forestry industry remain high.

A different situation is observed with respect to fatal accidents. In this area, the situation in opinion of authors is by far less optimistic because the rate of fatal accidents - fatalities per 100 000 employees remain relatively high. The number of fatalities is the highest among all industries. In recent years, the death toll in the forestry industry has been rather volatile (explained by the small absolute numbers of fatal accidents). In 2010 there were 6 fatal accidents registered (83.7 cases per 100 000), in 2011 - 3 cases (35.8 cases per 100 000); and in 2012, 4 fatal cases (42.4 cases per 100 000 employed). In year 2013 there have been no fatal accidents at work place in the forestry industry.

On the other hand, the report concludes that analysis of dynamics of total number of accidents in forestry sector compared to other sectors exhibits more rapid decrease in the number of accidents than in any other sector in Latvia as a whole.

According to the opinion of employees of companies working in the forestry sector the occupational health risk factors differs from the health risk factors general structure of the work environment. Evaluation of risk factors mentioned by employees, most of the risk factors are mentioned in either the same frequency as the average in the country or more often (in several cases even 2-3 times more often), which in the view of authors of survey shows that forestry belongs to high-risk sectors with diversified OH risk factors. Compared to previous surveys, only few factors are referred less frequently than average in the country. Risk factors that are mentioned less frequently are: direct contact with people who are not employees, high temperature, work with computer, electromagnetic field radiation and shift work.

It is reported that the overall situation with the employee information on a variety of labour protection issues in the forestry sector has improved. Progress in awareness of occupational health and safety issues by employees working in the forestry sector has been noted. By contrast, less than in average cases workers have pointed out the availability of information on how to act in emergency situations and familiarize themselves with the safety instructions. A significant decrease has been observed in the number of employees who think that information on occupational health and safety issues is not relevant in their work. Survey of employees shows that only few OH&S measures have been implemented more frequently in the forestry sector than in the average in the country, i.e. supplying working clothes and personal protective equipment, working environment risk assessment and vaccination. In turn, the dynamics over the years show increasing trend in purchasing/replacing of firefighting equipment, supplying workers with work clothes and personal protection means; mandatory health examinations; assessment of work environment risk factors; securing workers health insurance. The rest of the OH&S measures do not show any particular trend.

With regard to using of personal protective equipment and means, the overall conclusion is that the situation is improving. The survey shows more respondents understand the need to use personal protective equipment, but in terms of their use no specific changes are observed. The ratio of actual use of personal protective equipment in the forestry sector is slightly below the average in the country. 29% employees do not consider personal

protective equipment as a mean to prevent and minimise occupational health and safety risk factors at workplace.

With regard to assessment of occupational environment it is reported that in 52% cases the occupational environment risk factors do not meet the recommended or permissible occupational health and safety standards and norms as a whole from measurements made in 932 workplaces/processes. Occupational health risk factors that are most often exceeding recommended or permissible norms: noise - 72%, lighting - 61%, microclimate parameters (moisture - 34%, temperature - 48%, air velocity/exchange - 72%).

Authors of the survey note the relatively few occupational environment measurements at workplace in the forestry sector companies. In the view of the authors of the study, it could be linked to low perception of significance of quality of occupation environment by employers. It is also suggested that the industry is not fully aware of the importance of occupational environment measurements, as well as preventive measures to be taken (including mandatory health checks) in the context of occupational risk assessment. Self-employment is mentioned as contributing risk factor since self-employed persons are considered being at higher risk with regard to not following OH&S legal requirements compared with other type of entrepreneurship forms.

Situation with regard to occupational diseases analysed in the report cannot be directly evaluated for the purpose of the risk assessment since data are compiled for forestry and agriculture sectors combined.

The overall conclusions regarding the occupational health and safety situation in the forestry sector, based on sector related analysis report and expert opinion:

Accidents at the work place in the forestry sector per 100,000 employed in recent years compared to previous surveys remain relatively stable and in general are evaluated as medium high. However, the situation with regard to the heavy and fatal accidents is considered poor because the number of heavy and fatal accidents is still very high. In addition, the authors of the study outline the fact that companies in the forestry sector are very likely underreporting minor accidents happening in the workplaces, since the number of minor accidents is not correlating with the number of serious accidents, thus the total number of accidents should be higher than reported. It is concluded, that with regard to the number of accidents at the workplace, the forestry sector is still regarded as a priority sector. It is recommended that the State Labour Inspectorate should carry out regular thematic checks in the forestry sector.

The wood processing industry sector on the contrary to the forestry sector ranks top 3 of the industries with the highest number of accidents at the workplace. Wood processing accounts for 10% of all registered injuries at the workplace. However, despite the fact that biomass processing industry utilize a substantial share (e.g. up to 50%) of the primary feedstock originating from the wood processing industry, the occupational health and safety issues within the wood processing industry are not considered in the scope of the indicator. The outcome of the stakeholder consultation process along with the fact that health and safety issues from primary and secondary wood processing are not included in the scope of the assessment are in favour for designating “low risk” to this indicator. But taking into consideration outcomes of the forestry sector company survey and opinion of professional OH&S institutions, the risk level cannot be specified “low risk” for all operations in the forestry sector as the situation may vary significantly among the companies working in the forestry sector.

Low risk can be considered for:

	<ul style="list-style-type: none"> <li>• companies working as subcontractors for certified forest managers and are routinely checked for OH&amp;S issues or are implementing quality management systems in relation to OH&amp;S issues (OHSAS 18001 for example);</li> <li>• harvesting works are carried out exclusively with forest machinery (harvesters). “Specified risk” is considered for: Harvesting works carried out by manual harvesting means (chainsaws) in non-certified forests. Special focus shall be paid to self-employed persons and workers of microenterprises.</li> </ul>

Does the logging company agree to observe legally required health and safety requirements and audits by a representative of the organization?                  7.1 If yes: go to 8.                  7.2 If no: The material cannot be sourced</p> <p>8. Does field audit verify compliance with health and safety requirements?                  8.1 If yes, the material can be sourced as controlled material.                  8.2 If no, the material cannot be sourced.</p> <p>9. Does the logging company agree to establish procedures that ensure that all health and safety requirements in connection with forest harvesting are observed?                  9.1 If yes, go to 8.                  9.2 If no, the material cannot be sourced.</p>
--	---

	Indicator
<b>2.9.1</b>	Biomass is not sourced from areas that had high carbon stocks in January 2008 and no longer have those high carbon stocks.
Finding	<p>The high and increasing soil carbon stocks are considered to be in bogs, mires and valuable habitats in mature forests on organic soils. The bogs and mires, which have high biological value, according to Latvia legislation have protection regime. There are restrictions of management activities in forest stands surrounding biologically valuable mires and bogs to reduce potential impact on the valuable habitats.</p> <p>The forest operations shall be planned and implemented following the requirements set up in the Regulations of Cabinet of Ministers on tree felling in forest. The Nature protection regulations in forest management, Law on Environmental Protection and Species and Habitat Protection Act sets specific rules for management of protective and protected forests, including seasonal or continuous restrictions to extract biomass in order to protect valuable habitats and to secure sustainable and harmonized implementation of forest ecosystem services. The forest resource monitoring data indicates that during the last decade no significant artificial changes occurred in the protected areas, where the high carbon stocks are stored (wetlands, peat lands and protected mature forests on organic</p>

	<p>soils); therefore, no biomass could be sourced from areas that had high carbon stocks in January 2008. The artificial changes of carbon stock in bogs, mires and mature forests stands on organic soils protected under various protection regimes can be identified in the forest inventory data and information available in LSFRI Silava on request. These areas are clearly indicated and known to forest owners and managers.</p> <p>The risk can be considered as low for this indicator.</p>

	Indicator
<b>2.9.2</b>	<p>Analysis demonstrates that feedstock harvesting does not diminish the capability of the forest to act as an effective sink or store of carbon over the long term.</p>
Finding	<p>According to the procedures approved by the ministry of Environment protection and regional development on National system of accounting of emission units of greenhouse gases related to land use, land use change and forestry (LULUCF) sector, the LSFRI Silava and Ministry of Agriculture is responsible for carrying out the accounting of greenhouse gas emissions and CO2 removals in LULUCF sector, including reporting of forest management, afforestation and deforestation activities according to Articles 3.3 and 3.4 of the Kyoto protocol. The results of the inventory of the last decade indicate that the LULUCF sector is net CO2 sink. Since 2008 the living biomass in forest land annually absorbs about 5.8 mill. tones of CO2. The methodology for calculation of the GHG emissions and CO2 removals in LULUCF sector in Latvia are based on tier 2 and tier 1 according to the IPCC GPG 2006 and its Wetlands Supplement (2013). The information on the GHG emissions and CO2 removals are available from the UNFCCC website. Several scientific studies have been conducted in order to examine the land use structure and GHG emissions in Latvia since 1970. The most evident research activity targeted to improvement of the GHG inventory is the Forest sector competence centre funded project on evaluation of impact of forest management on GHG emissions and CO2 removals (2011-2015). The carbon stock in living biomass in forest land in Latvia in 1990-2008 increased from 164 mill. tons in 1990 to 236 mill. tons in 2008. Considerable increase of carbon stock takes place also in dead wood and harvested wood products carbon pools. Forest inventory data in Latvia is available</p>

	<p>since 2004; the stand wise inventory data are available since beginning of 20th century; however, they are not always consistent and complete. A research project is implemented in 2009-2010 to extrapolate the national forest inventory data to 1990, including deforestation and afforestation activities. The national forest inventory includes land use change, forest coverage, increment, mortality and commercial use of forest resources. The summaries of the National forest inventory are available on the website of the LSFRI Silava. The National forest inventory indicates that the total forest coverage is increasing, the sum of mortality and annual felling is smaller than the forest increment. However, share of mature forest stands with reduced annual increment is increasing, noting that in future mortality and felling stock might become larger than the annual increment, even in the felling stock is considerably reduced. The nature conservation activities, like conversion of drained forest lands to naturally wet forests will also considerably increase CO<sub>2</sub> and CH<sub>4</sub> emissions from forests due to increase of natural mortality and an increase in the share of poorly aerated forest soils. Currently felling stock is about 76%, if compared to the annual increment, except natural mortality. In the future, the felling stock and mortality will be higher than annual increment due to the aging of forests; however, forest regeneration following to the final felling will boost the removal of CO<sub>2</sub> in forests due to implementation of the climate change mitigation and adaptation targeted measures. The statistical information about forest carbon stock changes is calculated using the national forest inventory and the forest soil monitoring data. The analysis of the last decade (2003-2012) shows that the gross mean annual increment (including mortality) in forest in Latvia was 26.2 mill. m<sup>3</sup>, average felling stock, including deforestation – 13.9 mill. m<sup>3</sup>, natural mortality – 5.8 mill. m<sup>3</sup> and the net accumulation – 6.5 mill. m<sup>3</sup> annually. The main planning document is the forest management plan. The Forest Law defines rules of preparation of the forest management plans, defining procedures for preparation, approval and update of forest management plans. Forest management plans are prepared for a 10 years period and include forest inventory data and a description of the proposed management activities. Information of the forest management activities as well as the stand wise inventory data are stored in the State forest service maintained Forest register database. Taking into account information available in the Stand wise forest register and the National forest inventory there is no indication that forest activity could cause damage and negatively impact the forests potential to remove CO<sub>2</sub> from the atmosphere.</p>
<p>Means of Verification</p>	<ul style="list-style-type: none"> <li>• Results of analysis</li> <li>• Regional, publicly available data from a credible third party</li> <li>• The existence of a strong legal framework in the region.</li> </ul>

	Indicator
2.10.1	Genetically modified trees are not used.
Finding	<p>The National Programme on Biological Diversity outlines principal aims and objectives related to the using of genetically modified organisms in forestry. In particular programme calls for "Promoting conservation of Latvian forest genetic resources. (13.8.3)" and "Avoiding the use of genetically modified trees" (13.8.4). The main legal acts related to the use of GM trees in Latvia are as follows: The Law on Environment Protection, The Law on circulation of GMO, Regulation on Forest Reproductive Material. The Law on Circulation of GMO establishes the principal areas of activities involving genetically modified organisms and products, state management and regulation. The Law outlines the rights, duties and responsibilities of genetically modified organism and product users. The Law applies to all natural and legal persons who are importing, placing on the market, using, deliberately releasing GMO into the environment as well as those involved in testing, researching and other activities involving genetically modified organisms and products.</p> <p>Use of genetically modified reproductive material for commercial use is not banned according to Cabinet of Ministers regulations No. 159 "On Forest Reproductive Material". There is no evidence or facts provided by the responsible institutions about known or suspected use of GM trees in the country. According to the latest available FAO study ("Preliminary review of biotechnology in forestry, including genetic modification", 2004. (available at <a href="http://www.fao.org/docrep/008/ae574e/ae574e00.htm">http://www.fao.org/docrep/008/ae574e/ae574e00.htm</a>) Commercial use of GM trees is not practiced in the country.</p> <p>The state authorities responsible for controlling the use of GMO do not possess any information or evidence of unauthorized or commercial use of GM trees in Latvia. The State Plant Protection Agency, responsible for the management of registering of seeds/reproductive material - every registered seed shall be provided with information. There are no genetically modified seeds included in this register. The same way there are no any natural or legal persons cultivating genetically modified organisms in Latvia according to the register data.</p> <p>The risk can be considered as low for this indicator.</p>
Means of Verification	Reference sources, interviews and records show that GMOs are not used.
